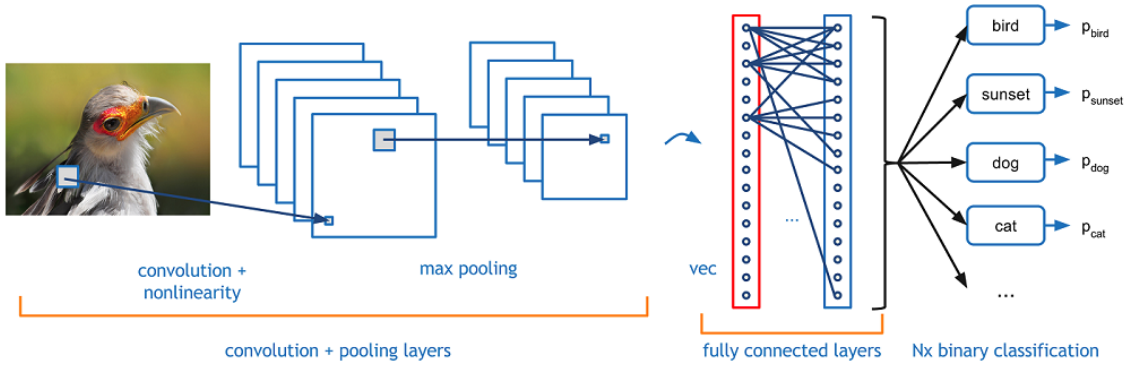
Convolutional Neural Networks (CNNs) +3

What is a convolutional neural network?

Answer | Request | Follow 76 | Comment | Share 2 | Downvote

A Beginner's Guide To Understanding Convolutional Neural Networks



UNDERSTANDING CONVOLUTIONAL NEURAL NETWORKS FOR NLP

When we hear about Convolutional Neural Network (CNNs), we typically think of Computer Vision. CNNs were responsible for major breakthroughs in Image Classification and are the core of most Computer Vision systems today, from Facebook's automated photo tagging to self-driving cars.

patterns; with more than one, you could look for patterns of patterns. Take the case of image recognition, which tends to rely on a contraption called a "convolutional neural net." (These were elaborated in a seminal 1998 paper whose lead author, a Frenchman named Yann LeCun, did his postdoctoral research in Toronto under Hinton and now directs a huge A.I. endeavor at

digital input and send output to other nodes. Layers upon layers of these nodes make up so-called convolutional neural networks, which, with sufficient training data, have become better and better at identifying images.

Inside a Convolutional Neural Network

But how does this filtering work? The secret is in the addition of two new types of layers: convolutional and pooling layers. We'll break the process down below, using the example of a network designed to do just one thing: determine whether a picture contains a grandma or not.

Next, Zweig and co optimized their own deep-learning systems based on convolutional neural networks with varying number of layers, each of which processes a different aspect of speech. They then used the

Got a tip? Let us know.

convolutional neural networks

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Convolution

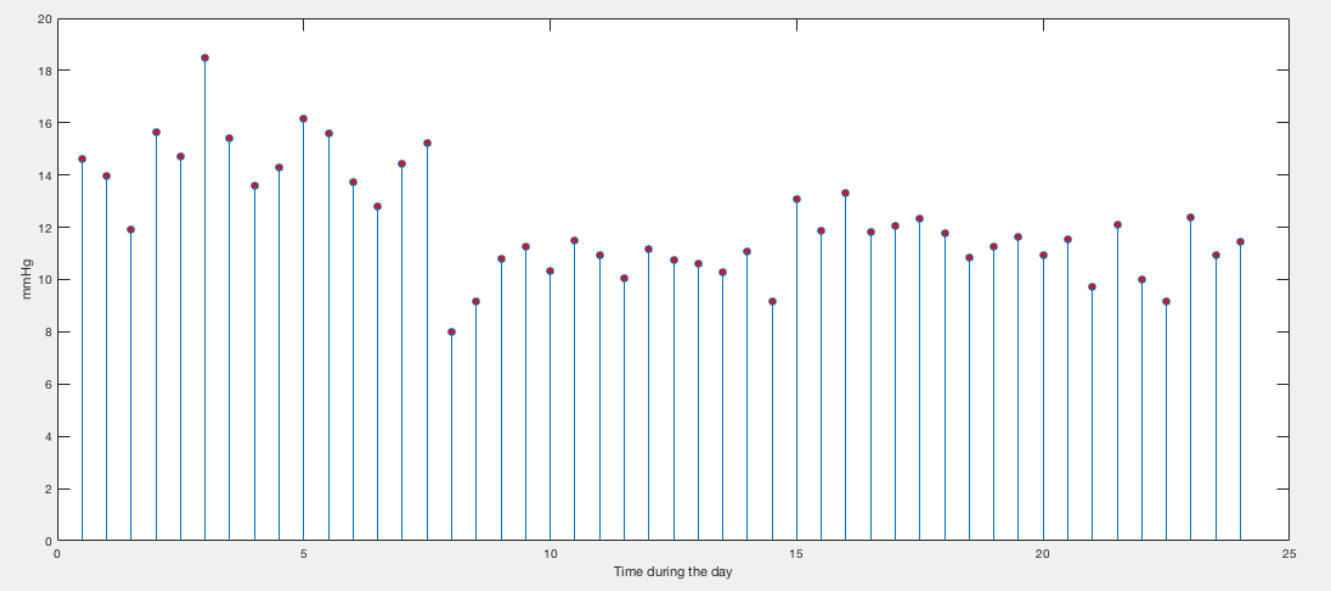
$$(f \star g)(t) = \int_{-\infty}^{\infty} f(t')g(t-t')dt'$$

Is Convolution that convoluted?

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Let us start with discrete 1D signals !

For example, my systolic blood pressure measured with a wearable over 24 hours on 1/16/2016:



$s[n]$

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Interested in the largest drop?

```
 15   14   12   16   15   18   15   14   14   16   16   14   13   14   15    8    9   11   11   10   11
-1    1
     -1    1
          -1    1
               -1    1
```

We are moving a sliding window and at every position we take the scalar product between the mask and the signal.

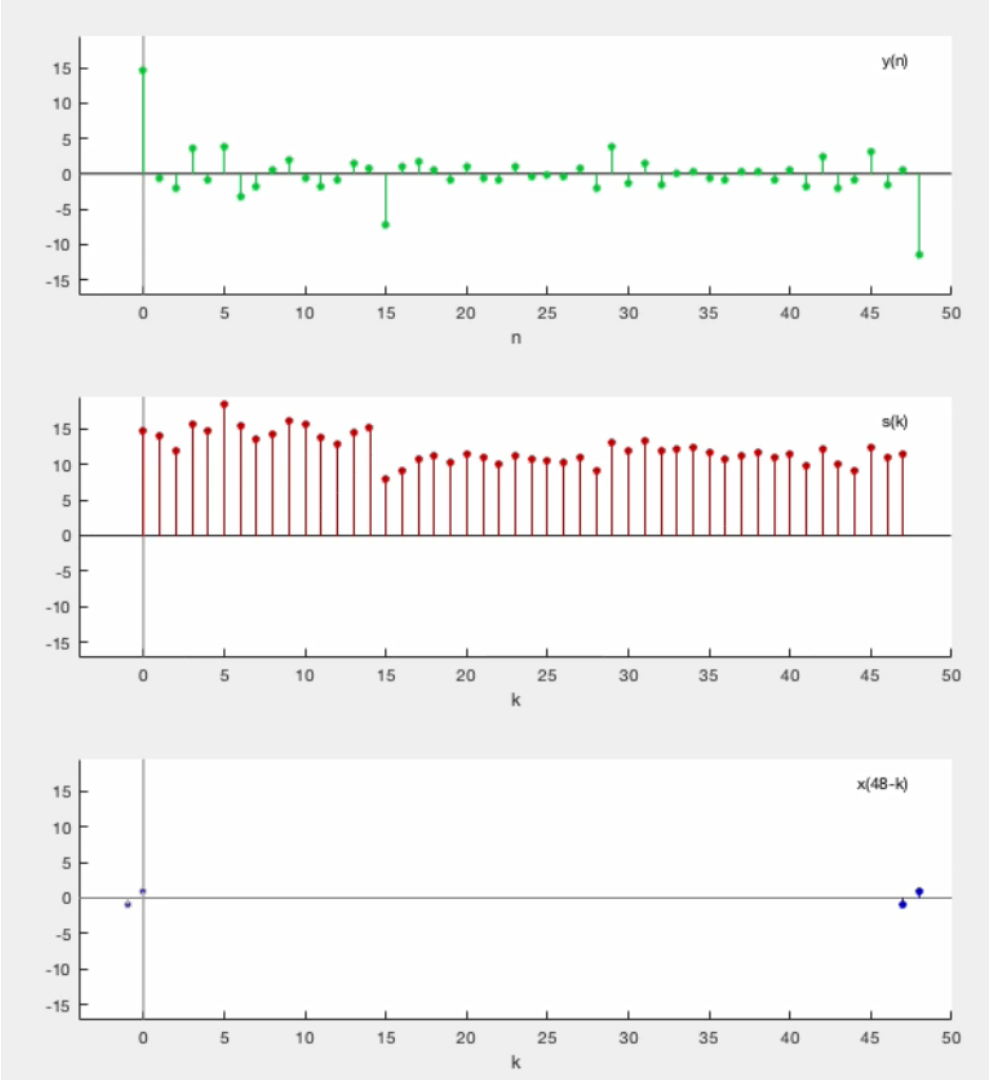
```
-1   -2    4   -1    4   -4   -1    0    2    0   -2   -1    1    1   -7    1    2    0   -1
```

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Let us visualize it while in action:

We will call this operation correlation between two discrete signals and we can write it as

$$y[n] = \sum_{k=1}^{N} s[k]\, h[k-n]$$



Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Convolution differs from correlation by a reflection:

We take the "mask" d[k] −1 1

and reflect it to d[-k] 1 −1

and then we shift to
d[-(k-n)]=d[n-k]

$$y[n] = \sum_{k=1}^{N} s[k]\, h[n-k]$$

1 −1

15 14 12 16 15 18 15 14 14 16 16 14 13 14 15 8 9 11 11 10 11

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

The informal term for the convolution mask is “filter mask”, its values are called “filter weights” or convolution weights.

Let us do another operation on the systolic pressure signal.

Taking the local average over a window of two hours.

The averaging mask would look like
[¼ ¼ ¼ ¼]

Does the convolution differ from correlation?

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

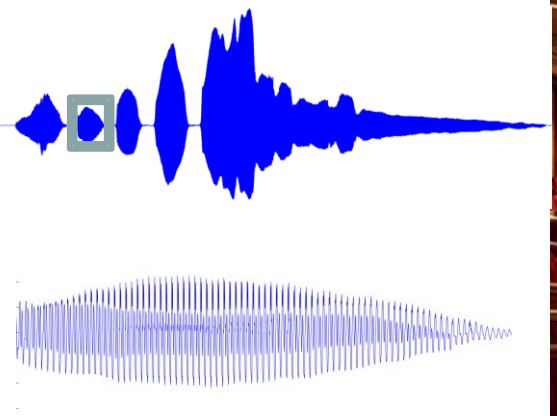
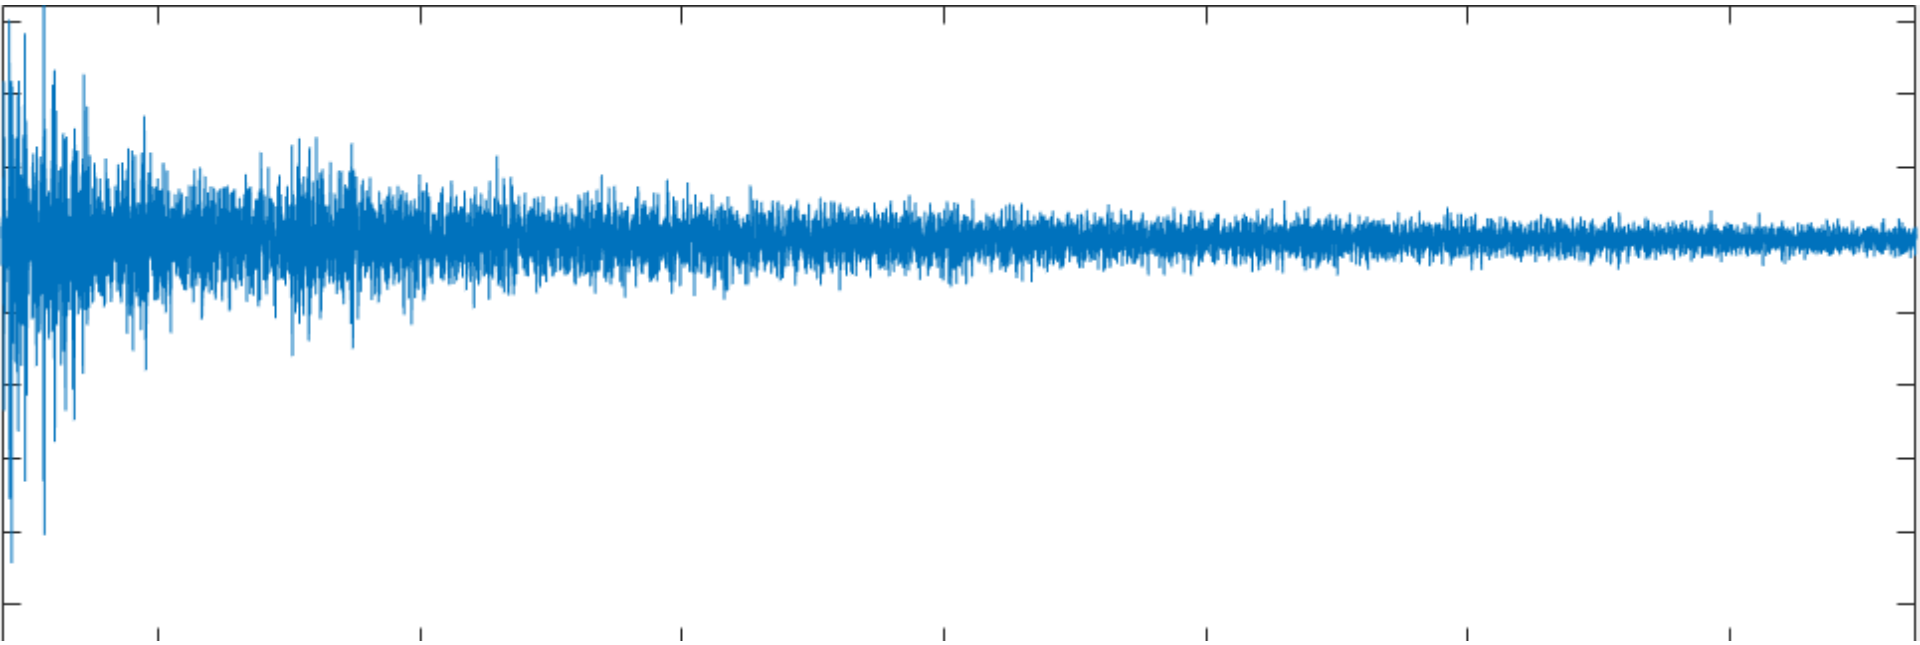
Let us move to the Academy of Music!



Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

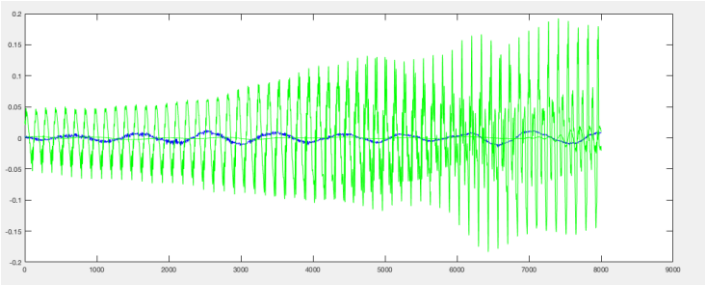
Sound is reflected creating multiple echos



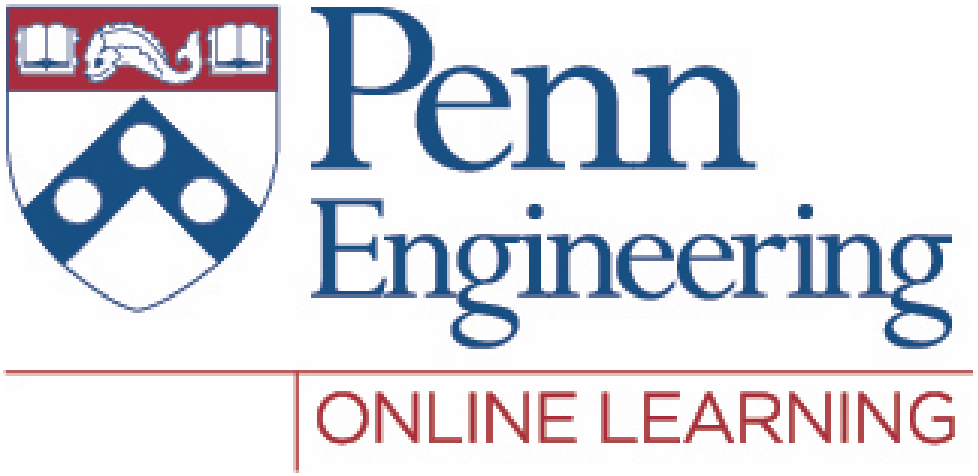
Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Now let us take the song s[n] and convolve it with the pistol h[n]

$$y[n] = \sum_{k=1}^{N} s[k]\, h[n-k]$$



Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

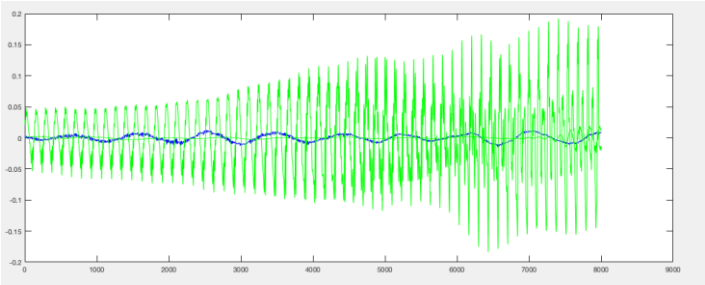


Video 2.2
Kostas Daniilidis

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

In the last lecture the song s[n] and convolve it with the pistol h[n]

$$y[n] = \sum_{k=1}^{N} s[k]\, h[n-k]$$

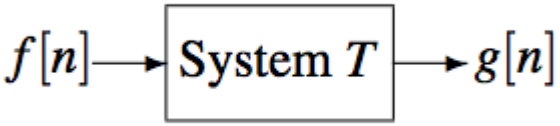


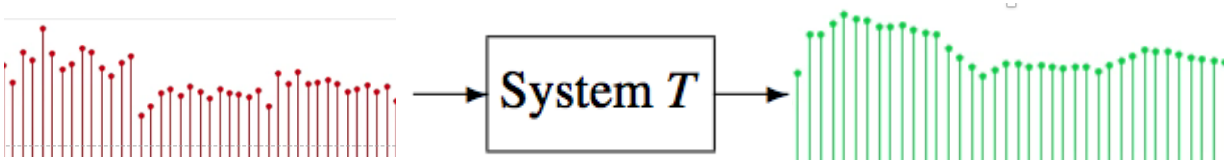
Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

The systems' view

Consider it as a system with input and output. In the previous examples, input might have been

- Audio like a song
- Blood pressure measurements
- In general any 1D signal

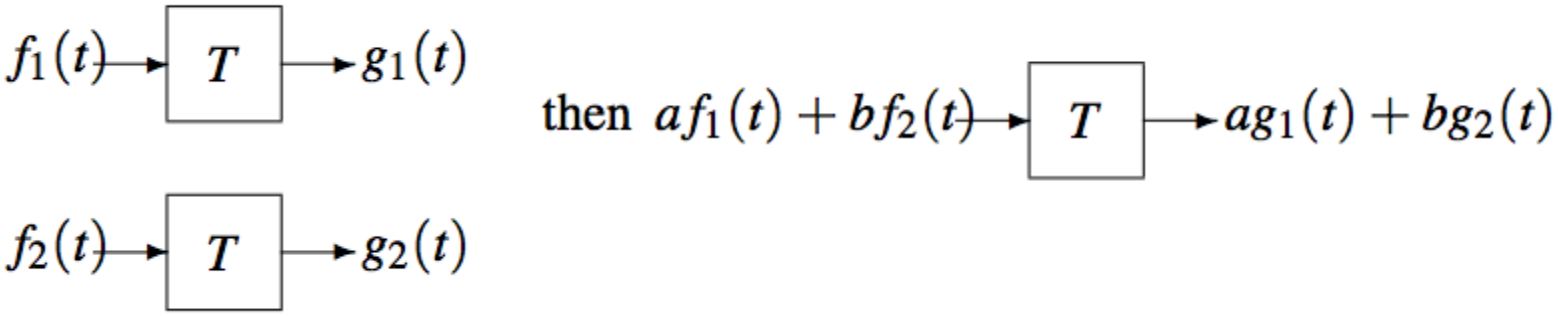




Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Linear System

- We will say that a system is linear if



Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Example

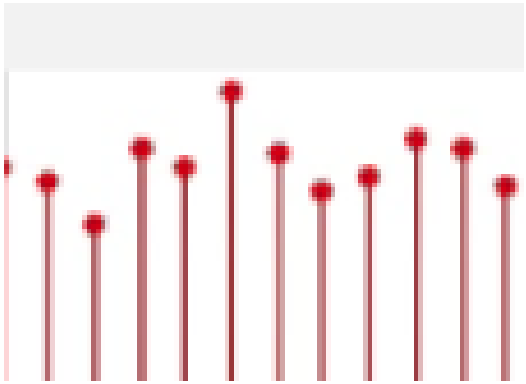
$T\{f\}(t) = f(t) - f(t-1)$ is linear:

$$
\begin{aligned}
g_1(t) &= f_1(t) - f_1(t-1) \\
g_2(t) &= f_2(t) - f_2(t-1) \\
T\{af_1 + bf_2\}(t) &= [af_1(t) + bf_2(t)] - [af_1(t-1) - bf_2(t-1)] \\
&= a(f_1(t) - f_1(t-1)) + b(f_2(t) - f_2(t-1)) \\
&= aT\{f_1\}(t) + bT\{f_2\}(t)
\end{aligned}
$$

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

What is non-linear?

$$g(t) = \max(f(t), f(t-1), f)t-2))$$



Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Shift-invariant (or time-invariant) system

Examples:

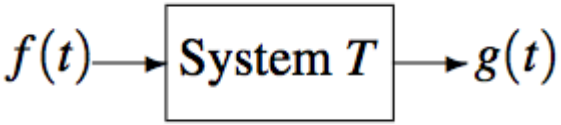
- $T\{f\}(t) = f(t) - f(t-1)$ is shift-invariant.

$$\begin{aligned} T\{f(t-t_0)\} &= f(t-t_0) - f(t-t_0-1) \\ &= g(t-t_0) \end{aligned}$$

- $g(t) = tf(t)$ is not shift-invariant.

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

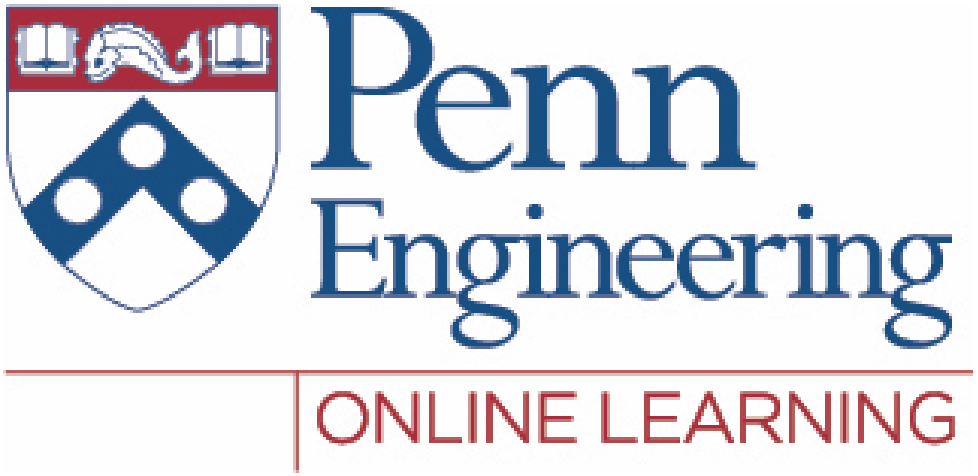
Is there a formula for describing linear shift-invariant systems?



Yes, the convolution! Discrete or continuous

$$g(t) = \int_{-\infty}^{\infty} f(t')h(t-t')dt' \qquad g[n] = \sum_{k=-\infty}^{\infty} f[k]\,h[n-k]$$

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi



Video 2.3
Kostas Daniilidis

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

What is a filter?

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Last lecture's main result: Linear shift-invariant systems can be written as convolutions!

$$g(t) = \int_{-\infty}^{+\infty} f(t')h(t-t')dt' = f(t) \star h(t)$$

But what exactly is this h(t) or h[n] that we call filter?

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

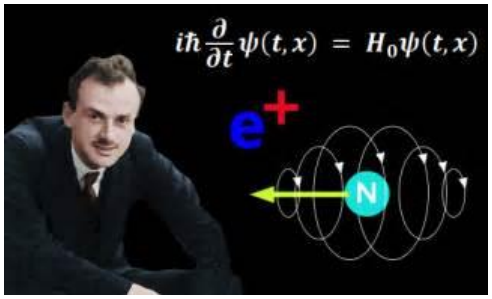
Box function

$$\text{rect}(t) = \begin{cases} 1\,, & |t| \le 1/2 \\ 0\,, & \textit{otherwise} \end{cases}$$

$$\text{rect}(t/a) = \begin{cases} 1/a\,, & |t| \le a/2 \\ 0\,, & \textit{otherwise} \end{cases}$$

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Dirac function



$$\delta(t) \doteq \lim_{a\to 0} \frac{1}{a} \operatorname{rect}(t/a)$$

It follows from definition of the Dirac function that

$$\delta(t) = 0 \quad \text{for all } t \neq 0$$

and

$$\int_{-\infty}^{+\infty} \delta(t)dt = 1$$

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Absorption property

$$\int_{-\infty}^{+\infty} \delta(t) f(t) dt = f(0)$$

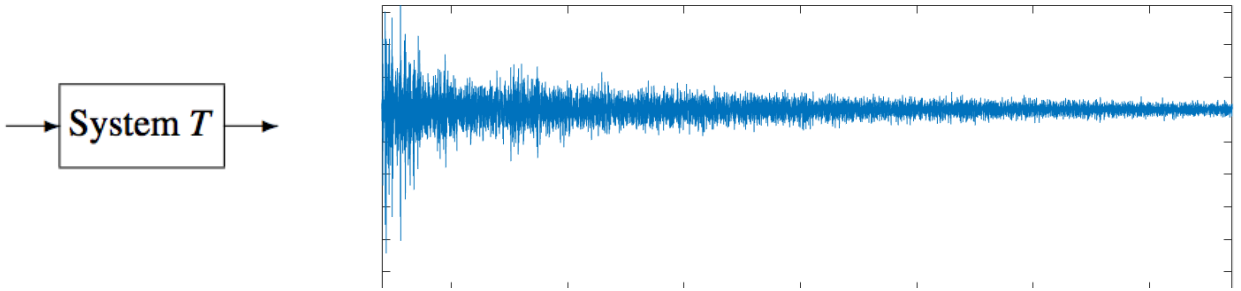
or in a more general form:

$$\int_{-\infty}^{+\infty} \delta(t - t_0) f(t) dt = f(t_0)$$

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

What happens when the input to an LSI is a Dirac?

$$\int_{-\infty}^{+\infty} \delta(t')h(t-t')dt' = h(t)$$



A filter *h(t) or h[n]* is the response of the system to the Dirac impulse.

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Example. Let an LSI system with impulse response defined as

$$h(t) = (1/2)(\delta(t+1) - \delta(t-1))$$

$$\begin{aligned}
g(t) &= \int_{-\infty}^{+\infty} f(t')h(t-t')dt' \\
&= \int_{-\infty}^{+\infty} f(t-u)h(u)du \\
&= \int_{-\infty}^{+\infty} f(t-u)(1/2)(\delta(u+1) - \delta(u-1))du \\
&= (1/2)\int_{-\infty}^{+\infty} f(t-u)\delta(u+1)du - (1/2)\int_{-\infty}^{+\infty} f(t-u)\delta(u-1)du \\
&= (1/2)(f(t+1) - f(t-1))
\end{aligned}$$

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Dirac description of sampling

- What do we get discrete signals out of analog?

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

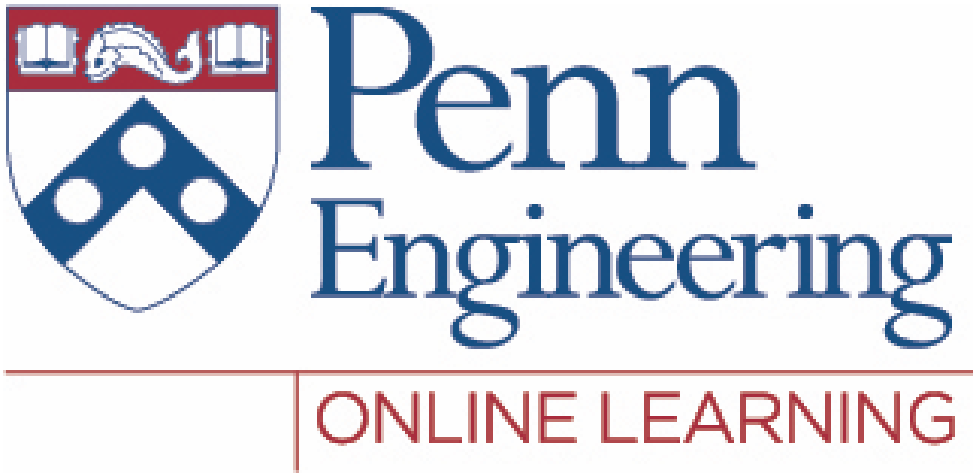
Sampling is multiplication with the comb

Sampling is a multiplication of the signal by the comb function $\mathrm{III}_T(t) = \sum_{n=-\infty}^{\infty} \delta(t - nT)$. T is the sampling interval:

$$f_S(t) = f(t) \sum_{n=-\infty}^{\infty} \delta(t - nT)$$

(S for "sampled") After sampling, we forget about the T: we just obtain a sequence of numbers, that we note $f_s[k]$.

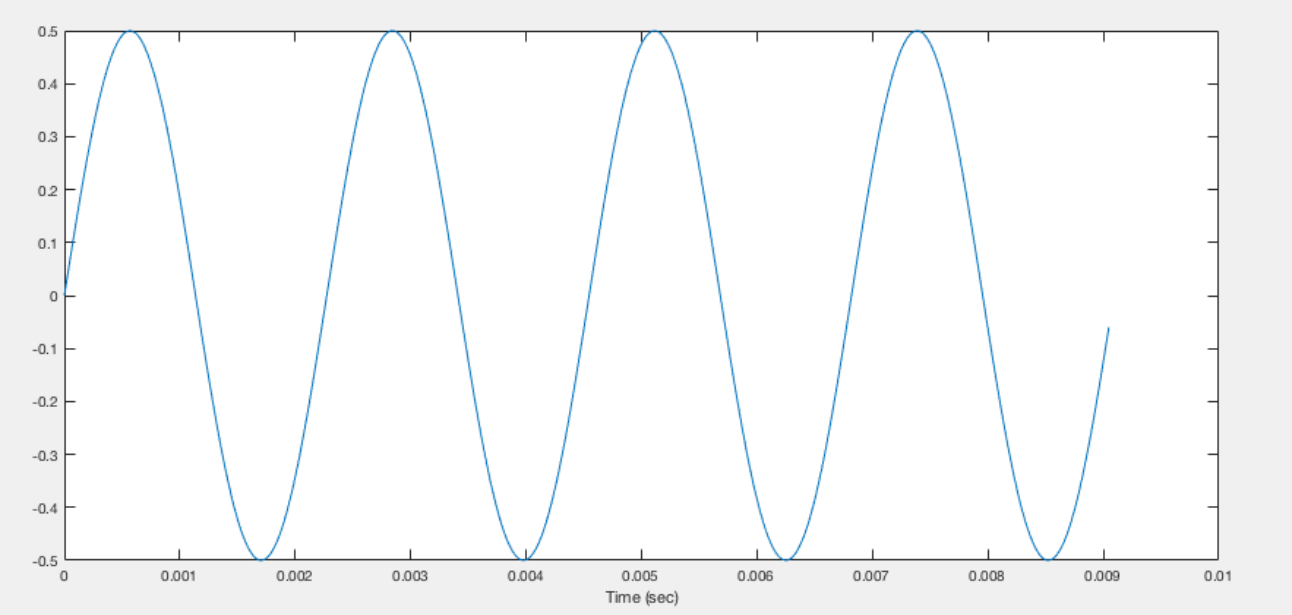
Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi



Video 2.4
Kostas Daniilidis

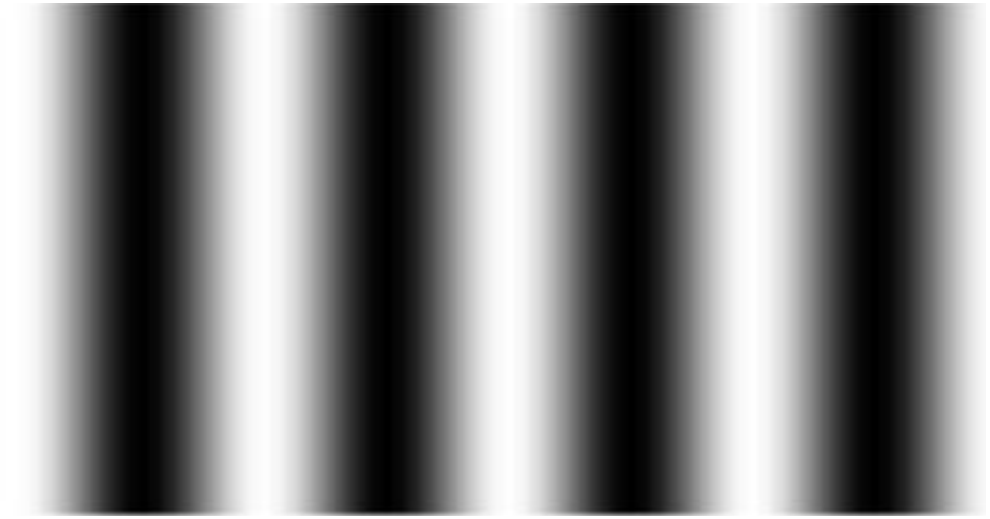
Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Back to music: sine wave 440Hz

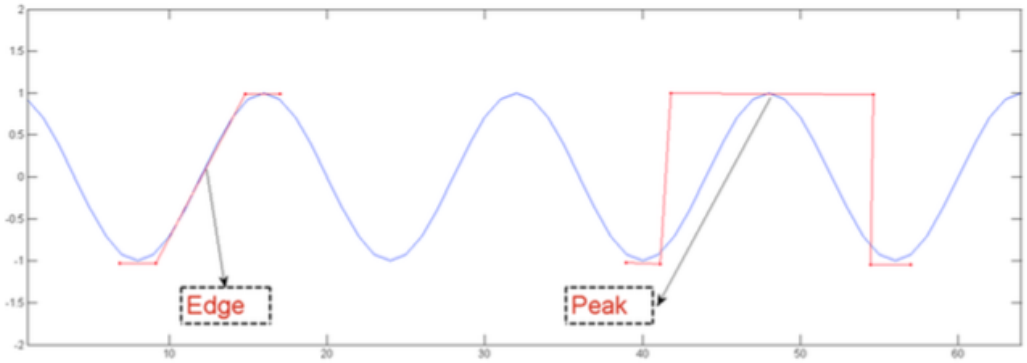


Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Or images….

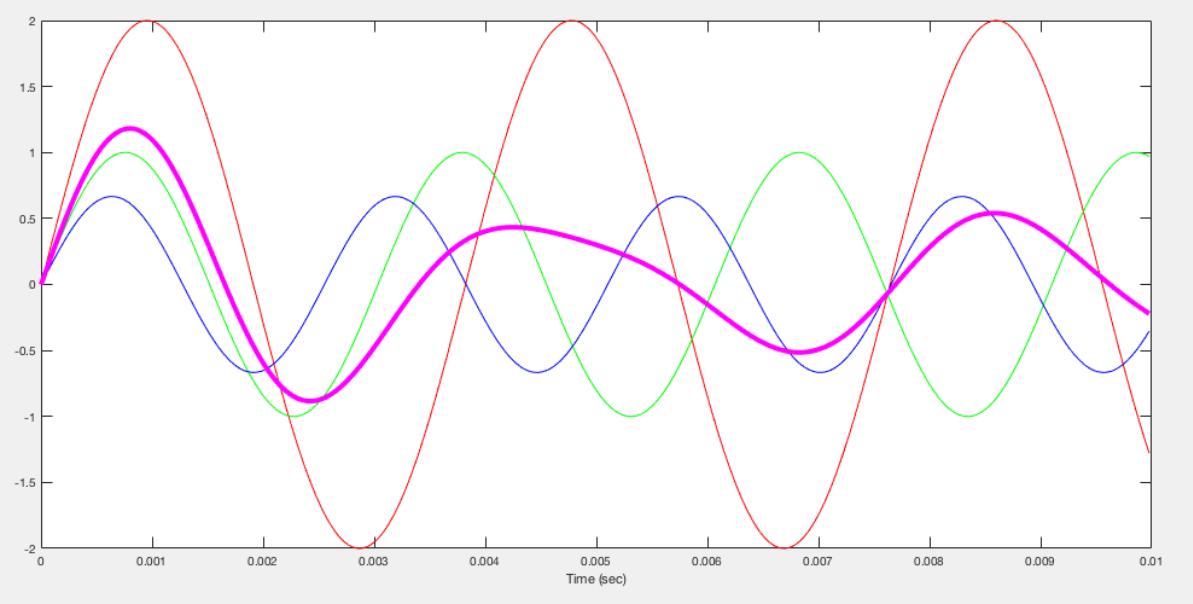


2D Signal $f(x, y) = \cos\left(\frac{2\pi x}{16}\right)$



Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

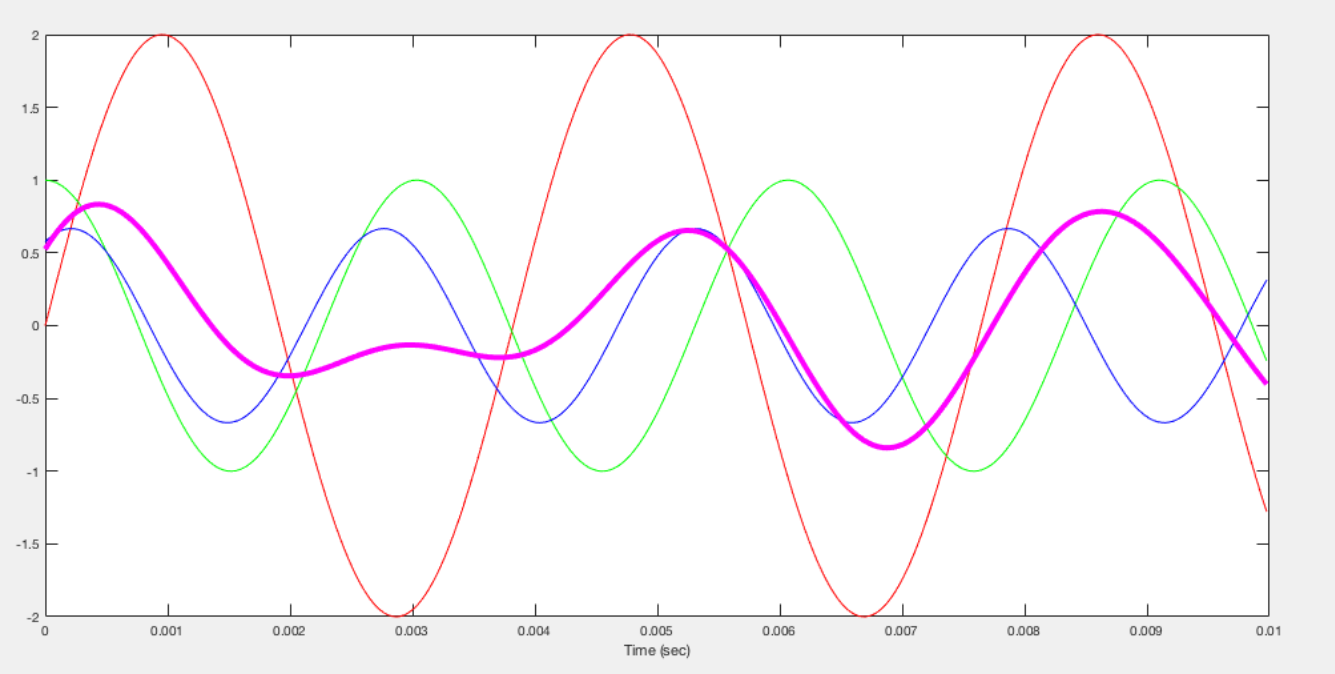
Play three notes together: C-major chord consists of a superposition of C (262Hz), E(330HZ) and G(392Hz)



$$A_1 \sin(2\pi f_1 t) + A_2 \sin(2\pi f_2 t) + A_3 \sin(2\pi f_3 t)$$

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

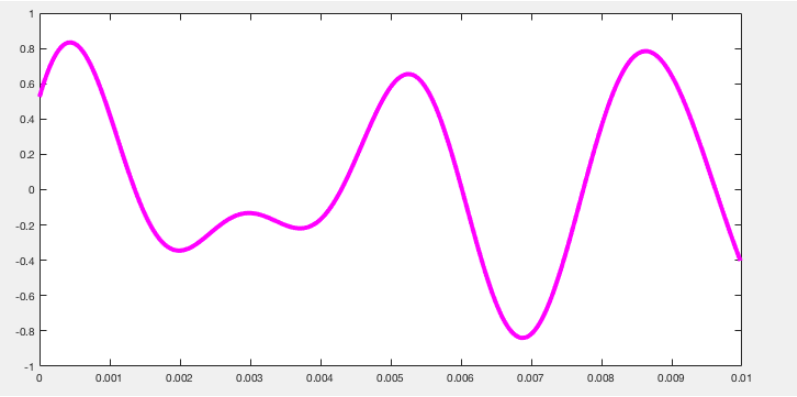
We could also change the phases:

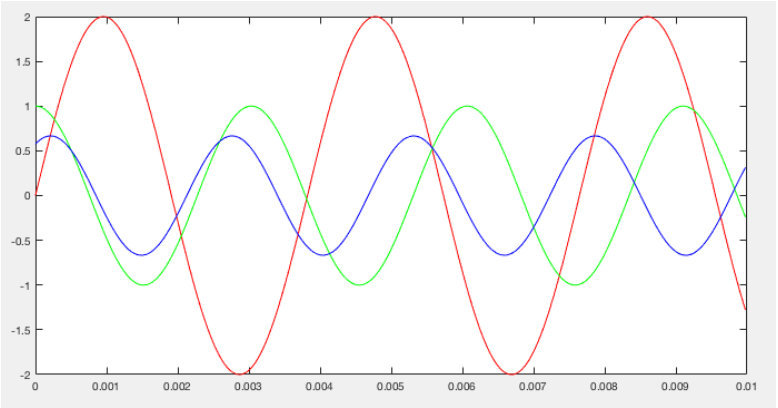


$$A_1 \sin(2\pi f_1 t) + A_2 \sin(2\pi f_2 t + \frac{\pi}{2}) + A_3 \sin(2\pi f_3 t + \frac{\pi}{3})$$

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

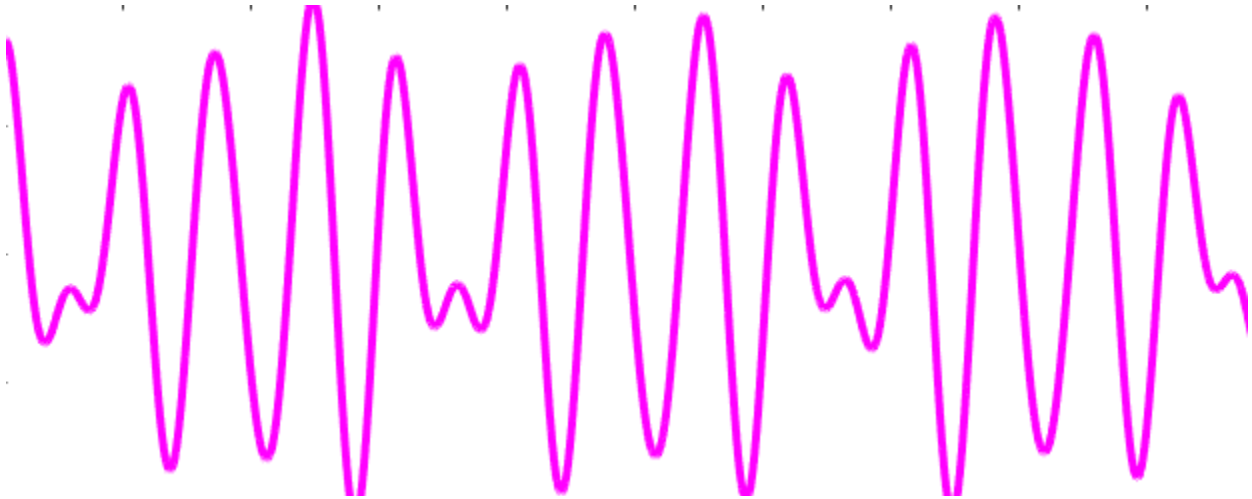
Can we solve the inverse problem?





Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Yes, we can decompose a function into "sinusoids" if it is periodic: Fourier series



$$f(t) = \sum_{n=-\infty}^{\infty} F[n] e^{j2\pi \frac{n}{T} t}$$

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

The complex Fourier coefficients F[n] can be found with the Fourier Transform

$$F[n] = \int_{-T/2}^{T/2} f(t) e^{-j2\pi \frac{n}{T} t} dt$$

$j^2=-1$

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Quick reminder on complex numbers:

- $a + jb \in \mathbb{C}$, $j^2 = -1$
- $e^{j\omega t} = \cos(\omega t) + j\sin(\omega t)$.
- $a + jb = re^{j\theta}$ with $r = \sqrt{a^2 + b^2}$, $\theta = atan2(b, a)$

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Why we need complex numbers?

To account for the phase

$$f(t) = \sum_{n=-\infty}^{\infty} F[n] e^{j2\pi \frac{n}{T} t}$$

or

$$f(t) = \sum_{n=-\infty}^{\infty} A_k(\cos(2\pi \frac{n}{T} t + \phi_k)$$

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Let us agree on a notation:

$$F[n] = \int_{-T/2}^{T/2} f(t) e^{-j2\pi \frac{n}{T} t} dt$$

Definition of the Fourier Transform:

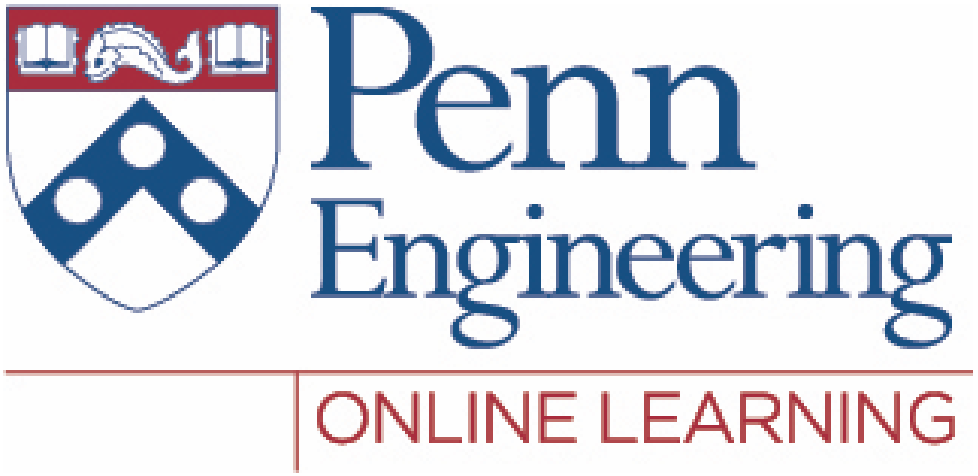
$$f(t) \circ\!\!-\!\!\bullet F(\omega) = \mathcal{F}\{f(t)\}$$

$$F : \mathbb{R} \to \mathbb{C}$$

$$F(\omega) = \int_{-\infty}^{\infty} f(t) e^{-j\omega t} dt,$$

where ω denotes the frequency. This definition is sometimes called non-unitary Fourier transform, with angular frequency (ω is referred to as angular frequency, and $s = \frac{n}{T}$ is the ordinary frequency in Hz such that $\omega = 2\pi s$).

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi



Video 2.5

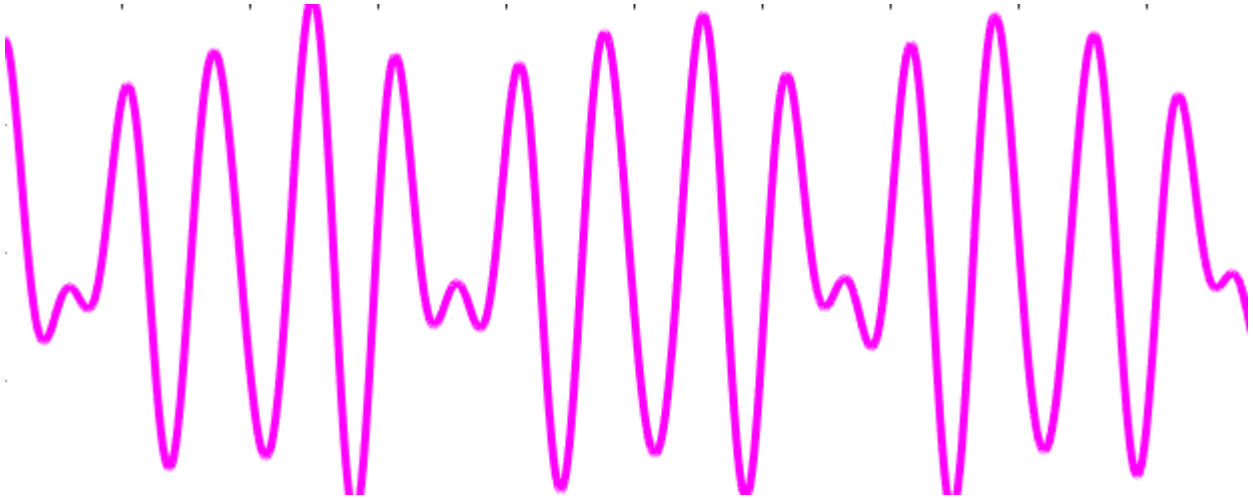
Some facts about the Fourier Transform

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

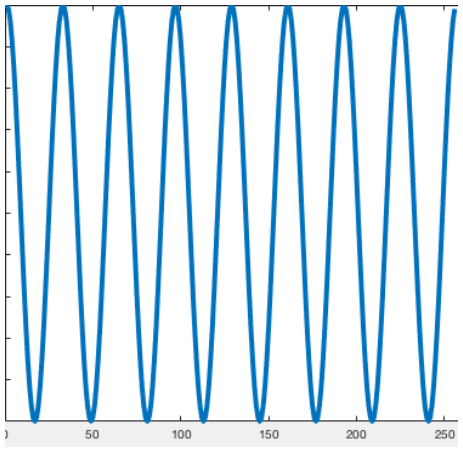
We learnt about the Fourier series of periodic signals

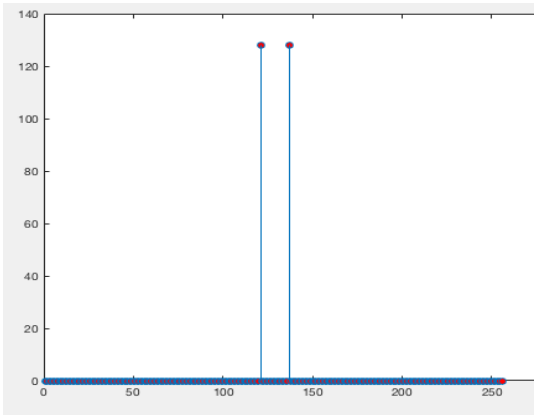


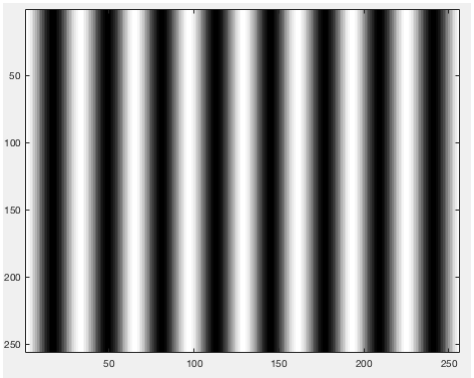
$$f(t) = \sum_{n=-\infty}^{\infty} F[n] e^{j2\pi \frac{n}{T} t}$$

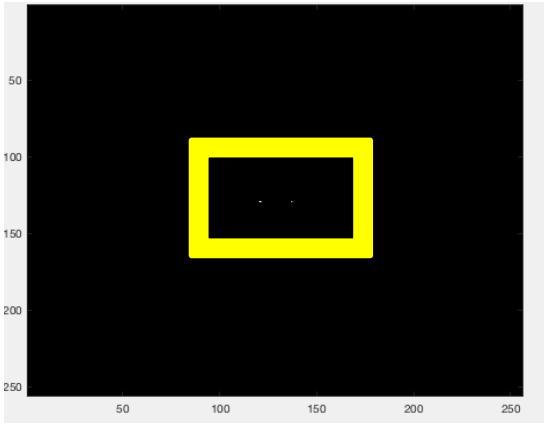
Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

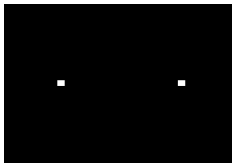
Fourier Transform of a Cosine





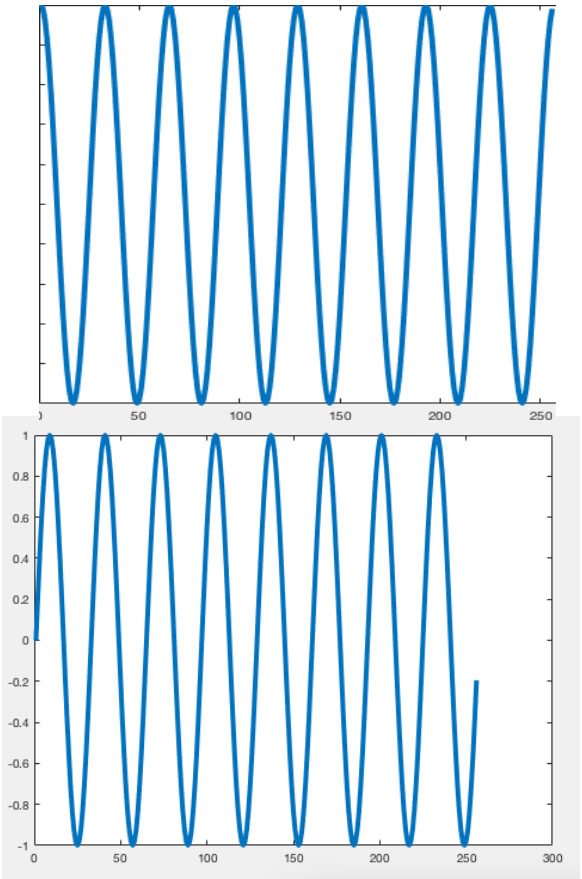




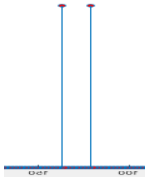


Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Do sine and cosine have the same Fourier transform



Only in the magnitude |F[n]|!



They differ in the phase !

$$\cos(\omega_0 t) \quad \multimap\bullet \quad 2\pi.\frac{1}{2}(\delta(\omega-\omega_0)+\delta(\omega+\omega_0))$$

$$\sin(\omega_0 t) \quad \multimap\bullet \quad 2\pi.\frac{1}{2j}(\delta(\omega-\omega_0)-\delta(\omega+\omega_0))$$

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Fourier of the harmonic exponential

$$e^{j\omega_0 t} \circ\!\!-\!\!\bullet\; 2\pi\delta(\omega - \omega_0)$$

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Two phase-related facts

Shift theorem

$$f(t-t_0) \multimap F(\omega)e^{-j\omega t_0}$$

Example: for $f(t)$ even, $f(t-\frac{T}{2}) \multimap F(\omega)e^{-j\omega\frac{T}{2}}$, where $F(\omega)$ is real.

Modulation theorem

$$f(t)e^{j\omega_0 t} \multimap F(\omega-\omega_0)$$

Multiplying by a complex exponential causes a shift in the frequency domain.

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Let us look at some more Fourier transforms: Dirac

Recall the absorption property

$$\int_{-\infty}^{\infty} \delta(t-t_0) f(t) dt = f(t_0)$$

Then we have:

$$\int_{-\infty}^{\infty} \delta(t) e^{-j\omega t} dt = 1$$

We will remember the two following results:

$$\delta(t) \quad \circ\!\!-\!\!\bullet \quad 1$$

$$1 \quad \circ\!\!-\!\!\bullet \quad 2\pi\delta(t) \quad \text{(DC-component)}$$

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Fourier of the comb function $\text{Ш}(t) = \sum_{n=-\infty}^{\infty} \delta(t - nT)$:

$$\sum_{n=-\infty}^{\infty} \delta(t - nT) \multimap \frac{1}{|T|} \sum_{n=-\infty}^{\infty} \delta(s - \frac{n}{T})$$

(or $\frac{2\pi}{|T|} \sum_{n=-\infty}^{\infty} \delta(\omega - \frac{2\pi n}{T})$ when using the non-unitary Fourier Transform with angular frequency).

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Step and sgn functions

Preliminary: The step function is defined such that $\frac{d}{dt}u(t) = \delta(t)$

The sign function comes handy: $\text{sgn}(t) = 2u(t) - 1,\ u(0) = 1/2$, or equivalently $u(t) = \frac{1}{2} + \frac{1}{2}\text{sgn}(t)$.

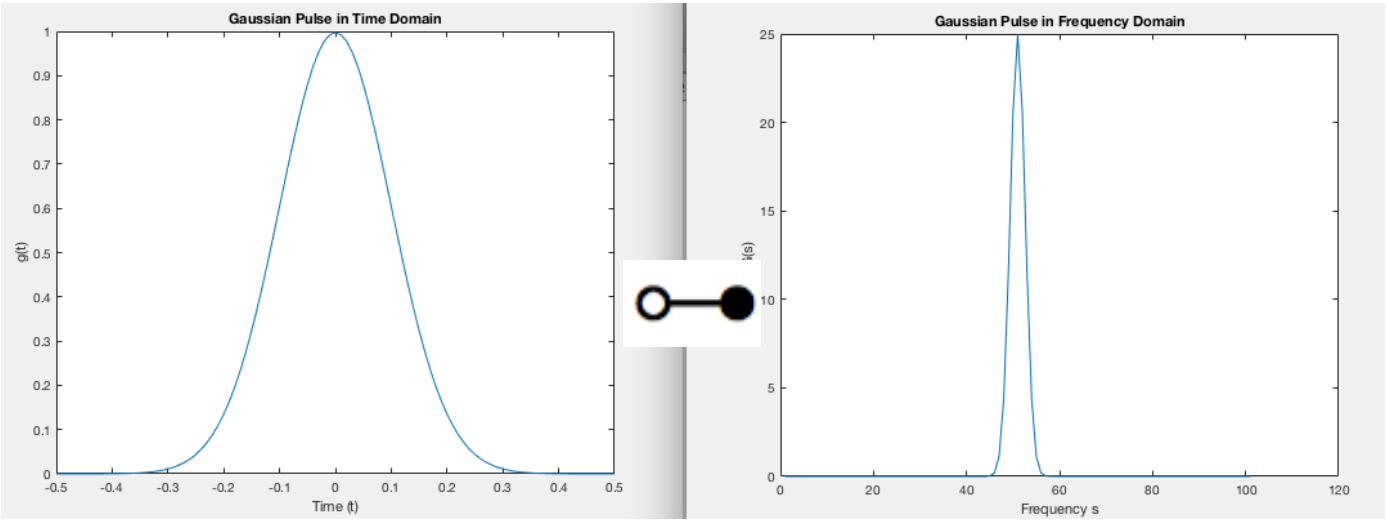
We have the following straightforward Fourier transforms:

$$u(t) \circ\!\!-\!\!\bullet\, \mathcal{U}(\omega) = \frac{1}{2}\delta(\omega) + \frac{1}{j\omega}$$

$$\frac{d}{dt}\text{sgn}(t) = 2\delta(t) \circ\!\!-\!\!\bullet\, j\omega\mathcal{F}(\text{sgn}(t)) = 2.$$

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Fourier Transform of the Gaussian Function



$$f(t) = \frac{1}{\sigma\sqrt{2\pi}} e^{-\frac{t^2}{2\sigma^2}} \quad \multimap \quad F(s) = \frac{1}{\sigma\sqrt{2\pi}} e^{-2\pi^2\sigma^2 s^2}$$

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Convolution Theorem

Convolution in frequency means multiplication in time or space

$$f(t) \rightarrow \boxed{h(t)} \rightarrow g(t) = \int_{-\infty}^{\infty} g(t')h(t-t')dt' = f(t) * h(t)$$

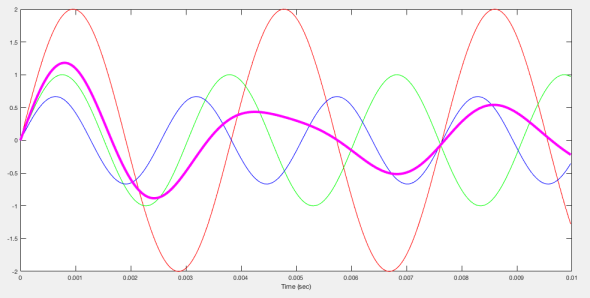
$$F(\omega) \qquad H(\omega) \qquad G(\omega)?$$

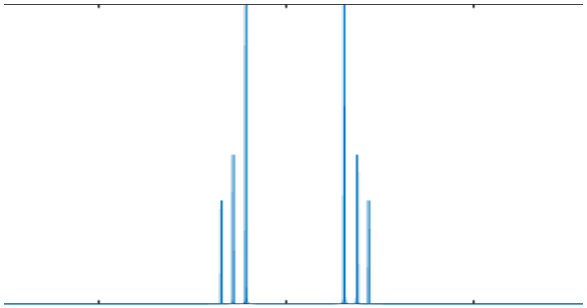
$$f(t) * h(t) \multimap F(\omega)H(\omega)$$

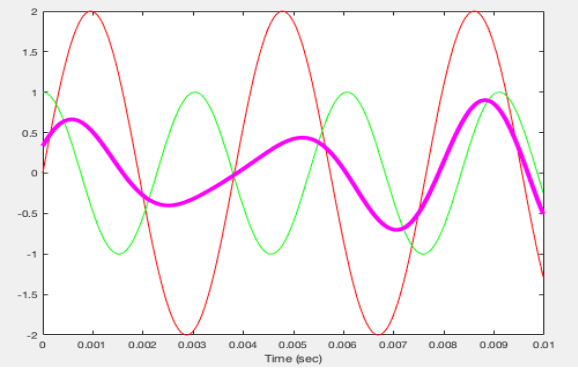
Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

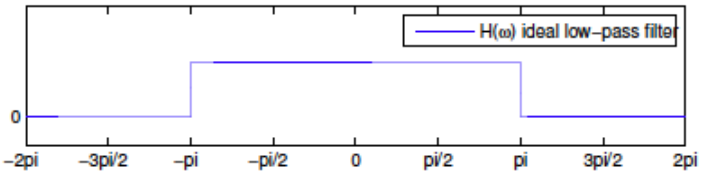
Convolution Theorem: Low Pass Filtering

$$f(t) * h(t) \multimap\!\bullet\; F(\omega)H(\omega)$$









Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Convolution Theorem II

Convolution in frequency means multiplication in time or space

$$f(t)h(t) \circ\!\!-\!\!\bullet\; F(\omega) * H(\omega)$$

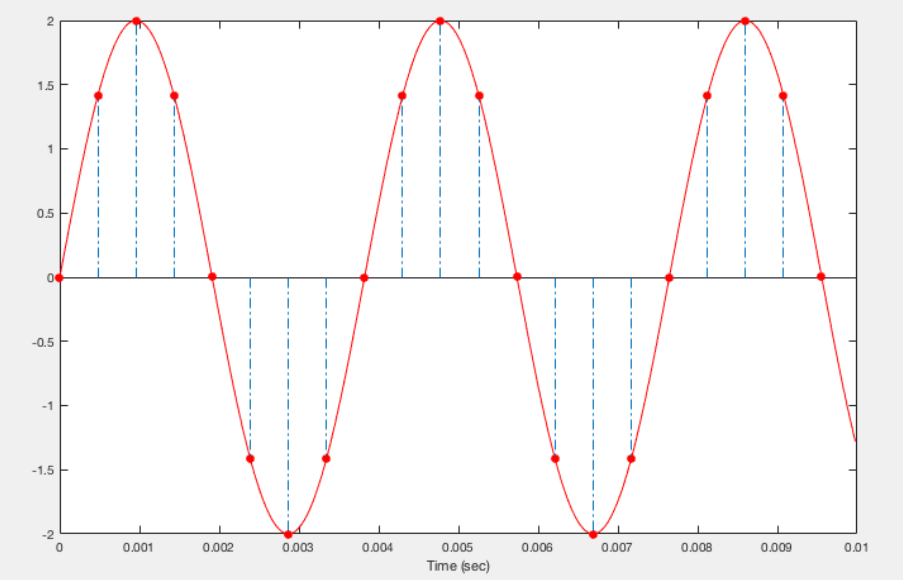
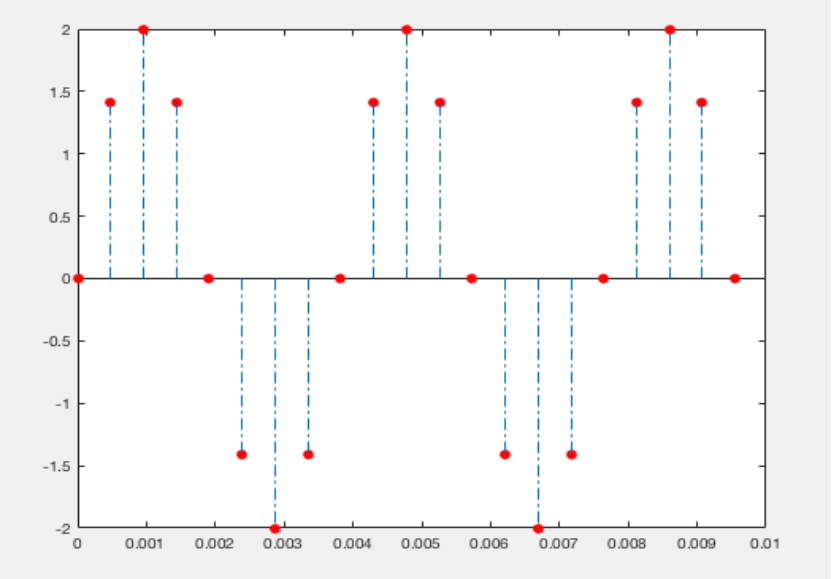
Optical **Illusions** and Mind Tricks to make people understand something. We see and feel and smell and touch ...

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Back to the sine-wave: sampling interval 1/8 of wavelength

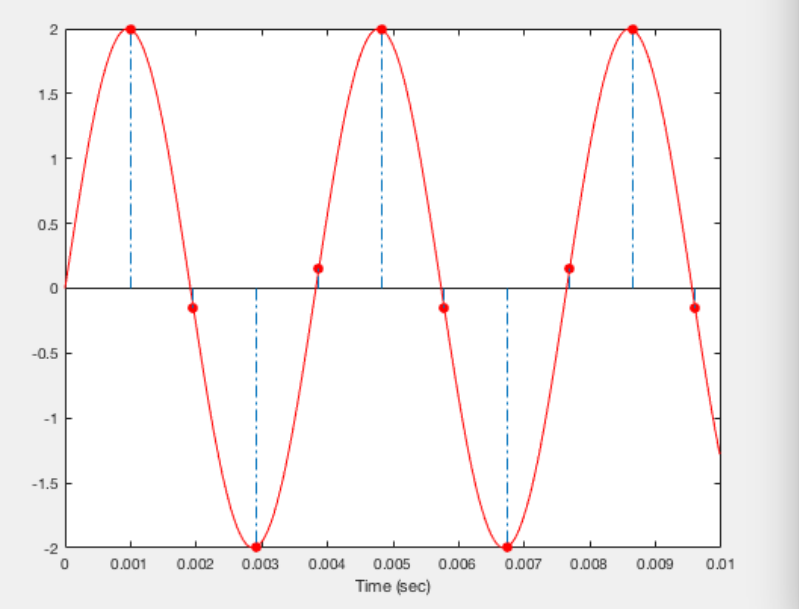


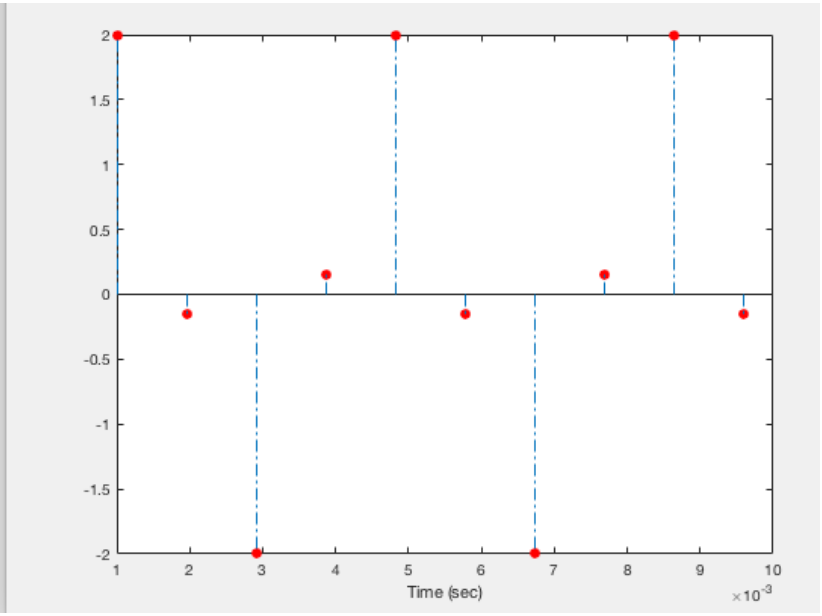


For note A (440 Hz), sampling frequency of 44.1kHz means 100 samples per wavelength !

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

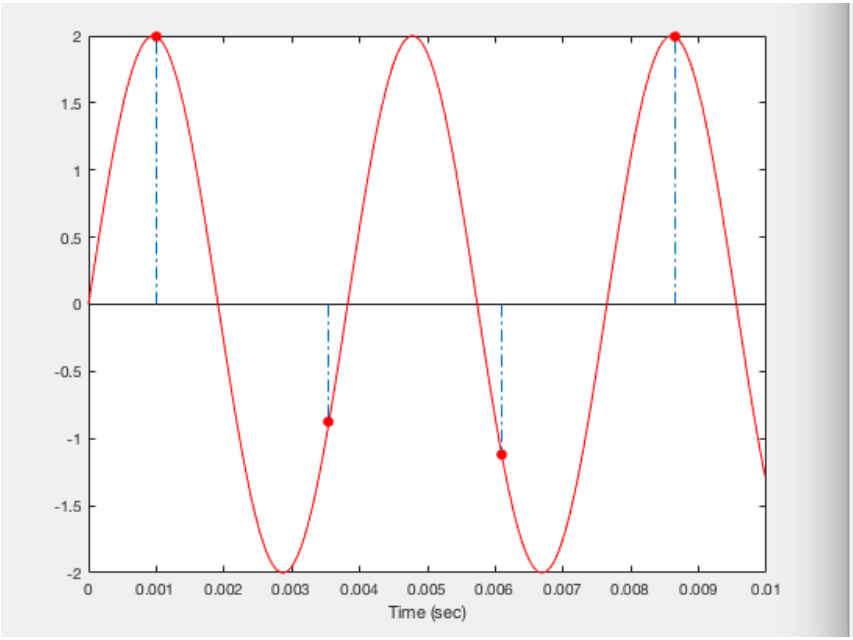
Increasing sampling interval to 1/4 of wavelength

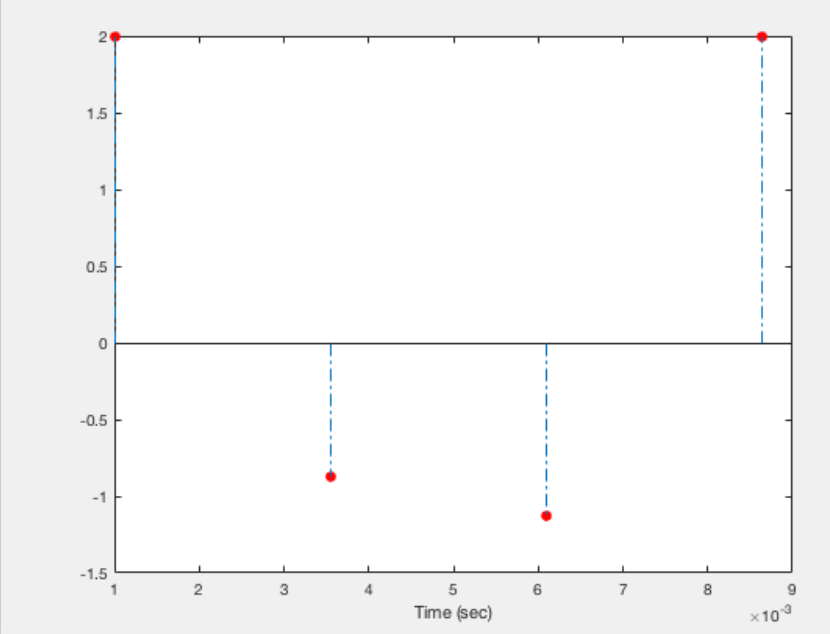




Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Increasing sampling interval to more than ½ of wavelength





We cannot reconstruct the original wave!

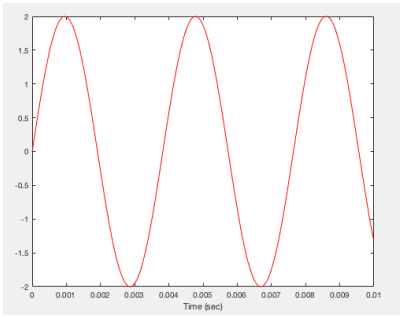
Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

What does sampling mean?

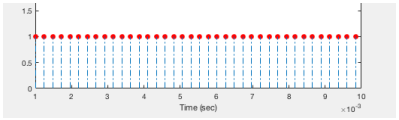
Sampling is a multiplication of the signal by the comb function $\text{Ш}_T(t) = \sum_{n=-\infty}^{\infty} \delta(t - nT)$. T is the sampling interval:

$$f_S(t) = f(t) \sum_{n=-\infty}^{\infty} \delta(t - nT)$$

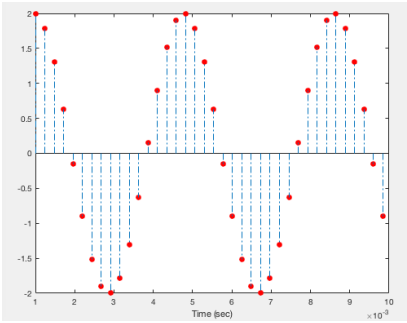
(S for "sampled") After sampling, we forget about the T: we just obtain a sequence of numbers, that we note $f_s[k]$.



x



=



Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Multiplication in time means convolution in frequency!

Question 1: what is the Fourier transform of the comb ?

$$\sum_{n=-\infty}^{\infty} \delta(t - nT) \circ\!\!-\!\!\bullet \sum_{n=-\infty}^{\infty} \delta(\omega - \frac{2\pi n}{T}) = \sum_{n=-\infty}^{\infty} \delta(s - \frac{n}{T})$$

A comb with inverse sampling interval!

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Question 2: What means convolution with a comb?

$$F_S(\omega) = F(\omega) * \sum_{n=-\infty}^{\infty} \delta(\omega - \frac{2\pi n}{T})$$

It is creating copies of the ”spectrum” at inverse time intervals!

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Question 3: Can we reconstruct the original spectrum from the "xeroxed" spectrum?

Only if the copies do not overlap ! Aliasing!

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Shannon-Nyquist Theorem

An analog signal can be reconstructed from sampling only if the sampling freqency is at least twice the maximum frequency; equivalently, if the sampling interval is less equal the minimum half the minimum wavelength.

Obviously the analog signal has to be bandlimited!

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

How can the reconstruction be realized?

Multiplying the spectrum of the sampled signal with the rectangle-function

$$\Pi(t) = \begin{cases} \frac{1}{2\pi} & -\pi \leq \omega \leq \pi \\ 0 & \text{anywhere else} \end{cases}$$

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Which function has the box as Fourier-transform?

$$\begin{aligned}\mathcal{F}^{-1}\{\mathrm{rect}(\omega)\} &= \frac{1}{2\pi}\int_{-\infty}^{\infty}\mathrm{rect}(\omega)e^{j\omega t}d\omega \\ &= \frac{1}{2\pi}\int_{-\frac{1}{2}}^{\frac{1}{2}}e^{j\omega t}d\omega \\ &= \frac{1}{2\pi}\frac{1}{jt}[e^{j\omega t}]_{-\frac{1}{2}}^{\frac{1}{2}} \\ &= \frac{1}{2\pi}\mathrm{sinc}\left(\frac{t}{2}\right)\end{aligned}$$

$$\frac{1}{2\pi}\mathrm{sinc}\left(\frac{t}{2}\right) \circ\!\!-\!\!\bullet\, \mathrm{rect}(\omega)$$

$$\frac{1}{2\pi}\mathrm{sinc}(\pi t) \circ\!\!-\!\!\bullet\, \frac{1}{2\pi}\mathrm{rect}\left(\frac{\omega}{2\pi}\right)$$

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Multiplication in frequency means convolution in time (space)

Reconstruction means convolution of the sampled signal with sinc

$$f_{reconstr}(t) = f(t) \sum_{n=-\infty}^{\infty} \delta(t - nT) * \frac{1}{2\pi}\text{sinc}(\pi t)$$

$$= \sum_{n=-\infty}^{\infty} f[nT]\frac{1}{2\pi}\text{sinc}(\pi(t - nT))$$

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Discrete time signals have still continuous Fourier transforms (CFT)!

$$f[n] \multimap \sum_{n=0}^{L-1} f[n] e^{-j\omega n}$$

Discrete time signals have continuous and periodic Fourier transforms with period 2π!
That's why we consider only the interval $(-\pi,\pi]$ when we talk about the CFT of a discrete signal!

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

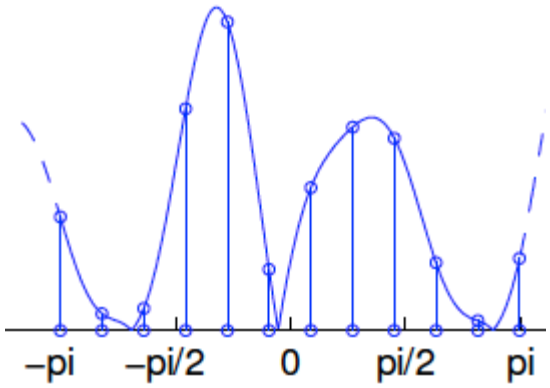
Example. Let $f[n]$ a discrete time signal and $h[n]$ a discrete time signal defined as:

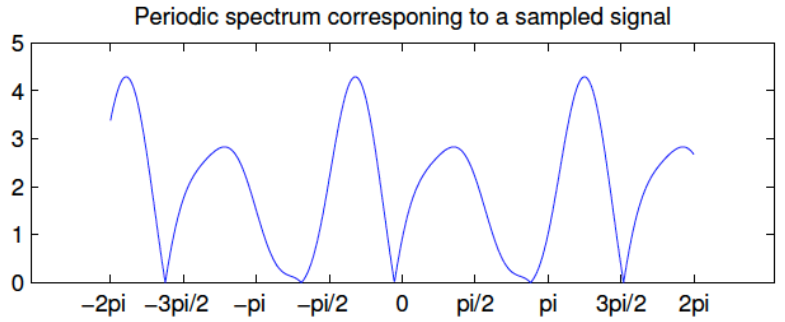
$$h[n] = \begin{cases} 1, & n = 0 \\ -1, & n = 1 \\ 0, & \text{elsewhere} \end{cases}$$

$$H(\omega) = \sum_n h[n]e^{-j\omega n} = h[0]e^{-j\omega \cdot 0} + h[1]e^{-j\omega \cdot 1} = 1 - e^{-j\omega}$$

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

What does discrete frequency mean?

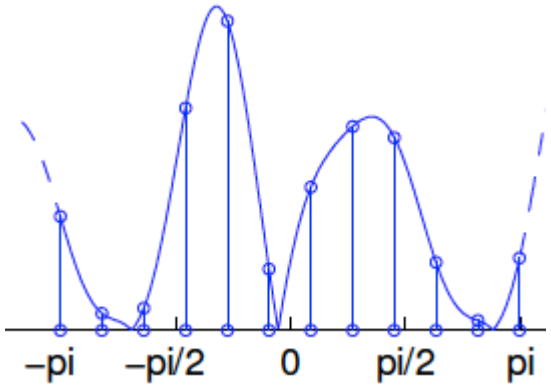


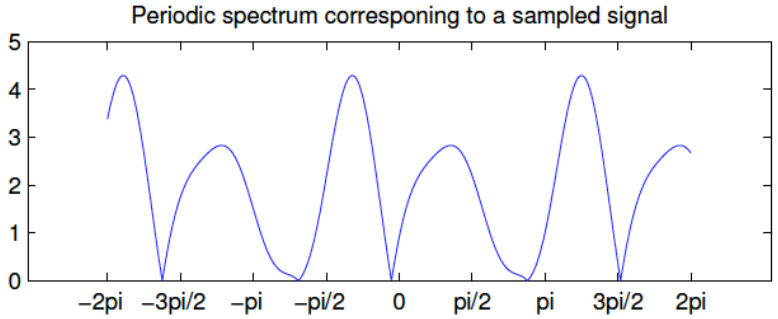


Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

What does sampling in the frequency domain correspond to in the time/space domain? It corresponds to a **convolution**:

- FREQUENCY DOMAIN: multiplication with $\sum \delta(\omega - \frac{2\pi k}{L})$
- TIME DOMAIN: convolution with with $\sum \delta[n - kL]$, equivalent to **replication of the signal at multiples of its length.**





Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Why is the DFT of a discrete time finite signal same as the CFT?

Because sampling the frequency domain only means replicating the original signal.

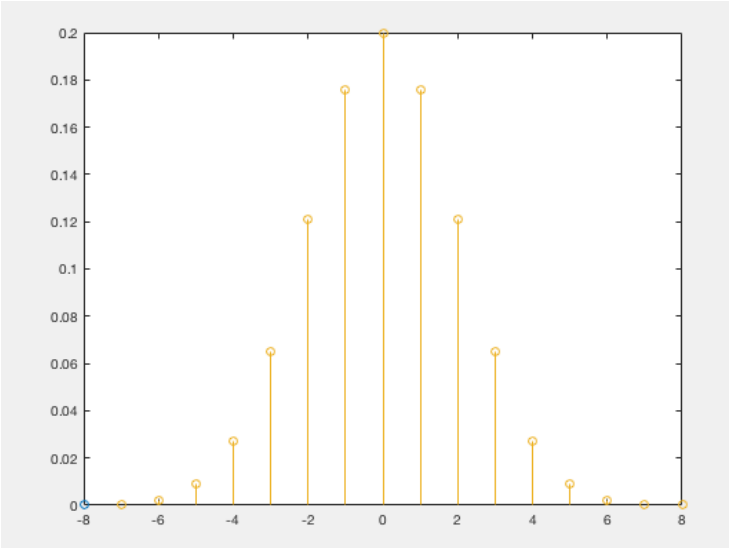
Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

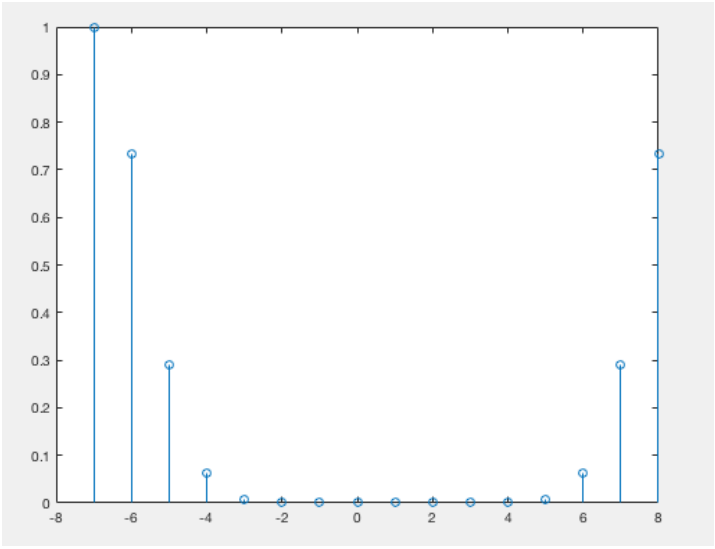
Some MA

```
support = 16;
sigma = 2;
d = -floor(support/2)+1:floor(support/2);
g = (1/(sigma*sqrt(2*pi)))*exp(-d.^2/(2*sigma^2));

figure(1)
stem(d,g);

figure;
stem(d,abs(fft(g)));
```



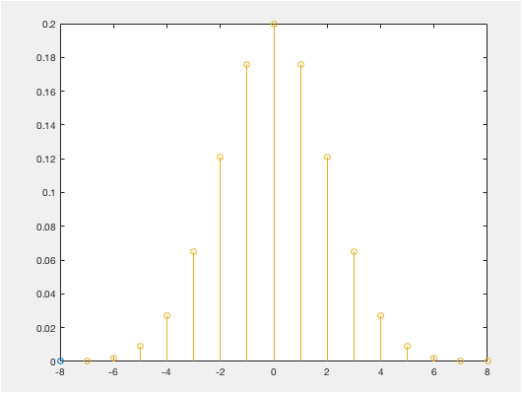


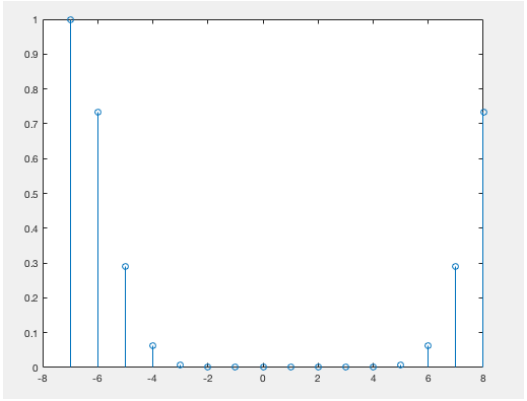
Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

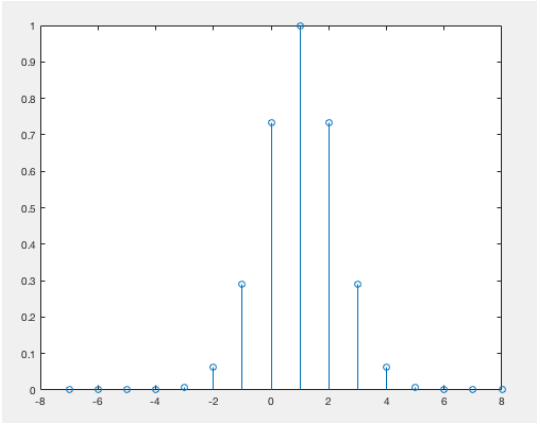
fftshift…

`fftshift(fft(f))` performs a shift by $\frac{L}{2}$

(modulation of the signal by $e^{\frac{-j2\pi L/2}{L}} = e^{-j\pi} = -1$)







Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

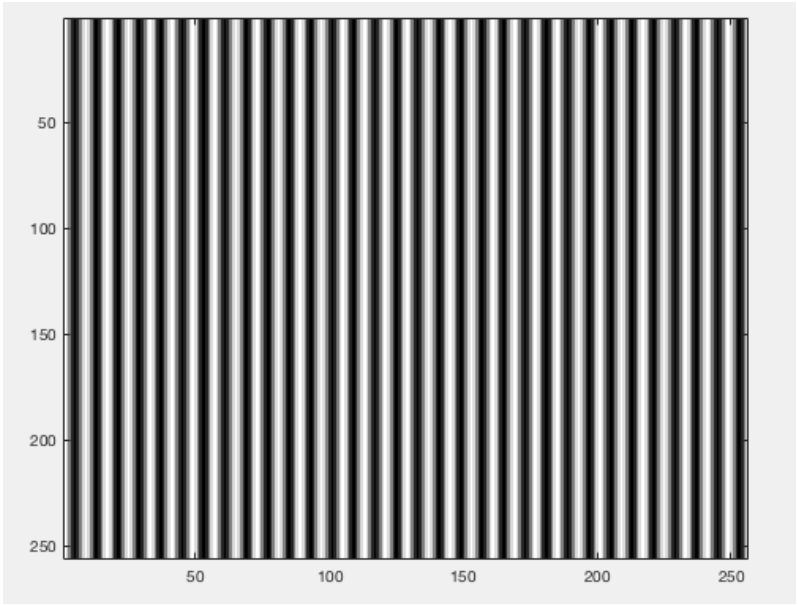
2D Fourier Transform

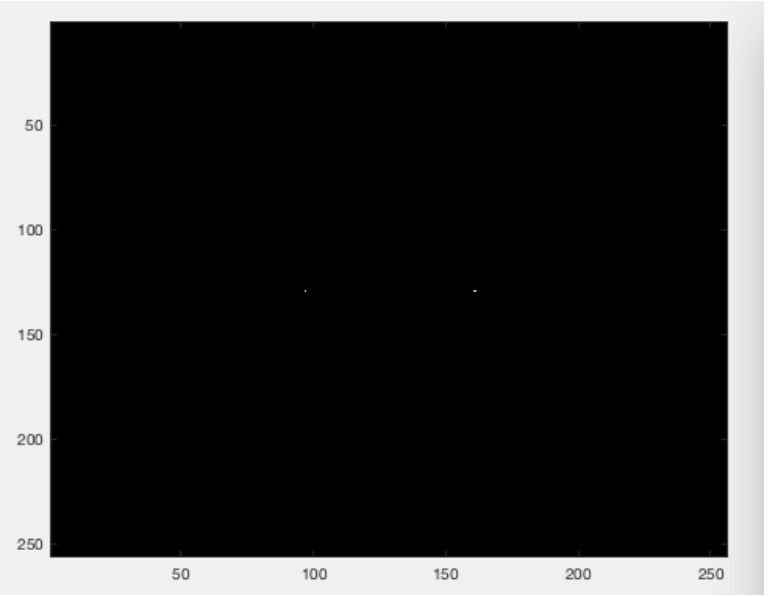
$$f(x,y) \circ\!\!-\!\!\bullet \int_{-\infty}^{\infty}\int_{-\infty}^{\infty} f(x,y)e^{-j\omega_x x+\omega_y y}dxdy$$

$$F(\omega_x,\omega_y) \bullet\!\!-\!\!\circ \left(\frac{1}{2\pi}\right)\int_{-\infty}^{\infty}\int_{-\infty}^{\infty} F(\omega_x,\omega_y)e^{\cdots}d\omega_x d\omega_y$$

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Example: 1D-cosine as an image





$$f(x,y) = \cos(\omega_0 x) \qquad f(x,y) \multimap\!\bullet \frac{1}{2}(\delta(\omega_x - \omega_0) + \delta(\omega_x + \omega_0)).\delta(\omega_y)$$

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Separable functions

$$f(x,y) = f_1(x)f_2(y) \multimap \int_{-\infty}^{\infty} f_1(x)e^{-j\omega_x x}dx \int_{-\infty}^{\infty} f_2(y)e^{-j\omega_y y}dy = F_1(\omega_x)F_2(\omega_y)$$

$$f(x,y) = \cos(\omega_1 x)\cos(\omega_2 y)$$

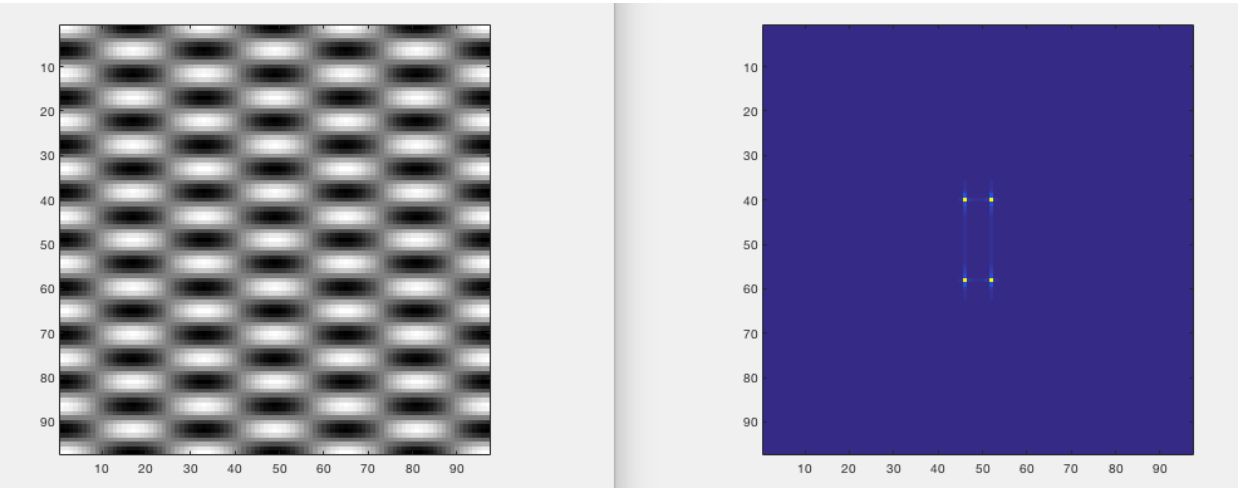
$$\frac{1}{2}(\delta(\omega_x - \omega_1) + \delta(\omega_x + \omega_1))\frac{1}{2}(\delta(\omega_y - \omega_2) + \delta(\omega_y + \omega_2))$$

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Separable functions

$$f(x,y) = \cos(\omega_1 x)\cos(\omega_2 y)$$

$$\frac{1}{2}(\delta(\omega_x - \omega_1) + \delta(\omega_x + \omega_1))\frac{1}{2}(\delta(\omega_y - \omega_2) + \delta(\omega_y + \omega_2))$$



Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

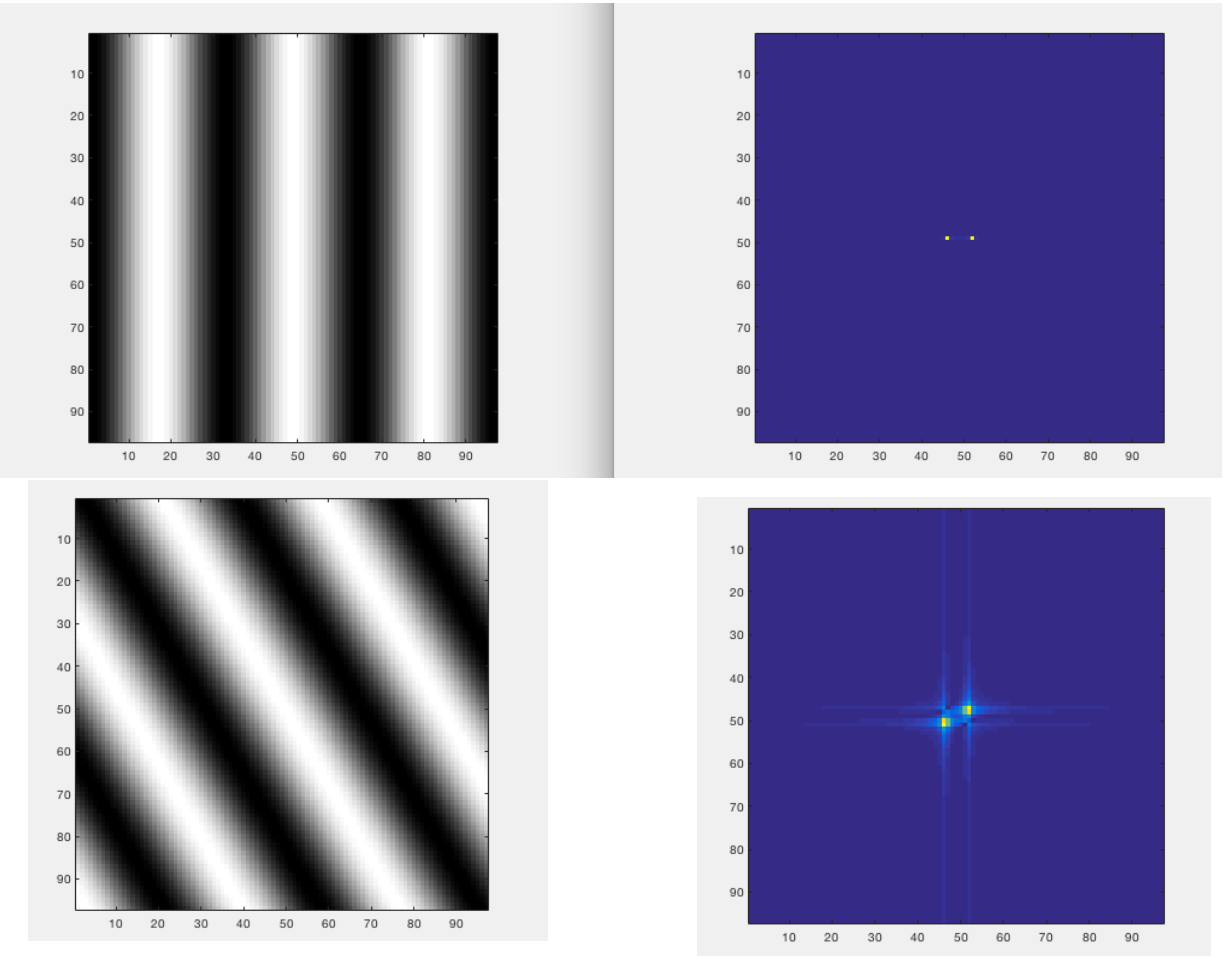
Shift Theorem in 2D

$$f(x-x_0, y-y_0) \multimap\!\bullet\; F(\omega_x, \omega_y) e^{-j(\omega_x x_0 + \omega_y y_0)}$$

If we know the phases of two 1D signals we can recover how their relative displacement? But can we do that for 2D images?

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

2D rotation



Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

2D rotation

$$f * R\begin{pmatrix} x \\ y \end{pmatrix} \multimap\!\bullet\; \mathcal{F}\left(R\begin{bmatrix} \omega_x \\ \omega_y \end{bmatrix}\right)$$

Proof of Commutative property

- $g[m,n] = I \otimes f = f \otimes I$
- $g[m,n] = I \otimes f = \sum_{k,l} I(m-k, n-l) * f(k,l)$
- Let $k' = m - k, l' = n - l,$
  then $k = m - k', l = n - l'$
- $g[m,n] = \sum_{k',l'} I(k',l') * f(m-k', m-l') = f \otimes I$

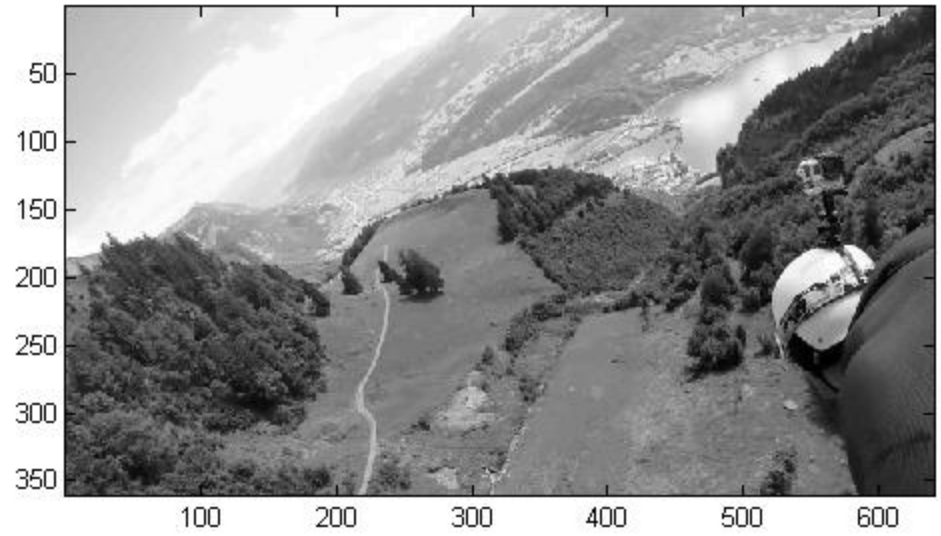
Edge Detection

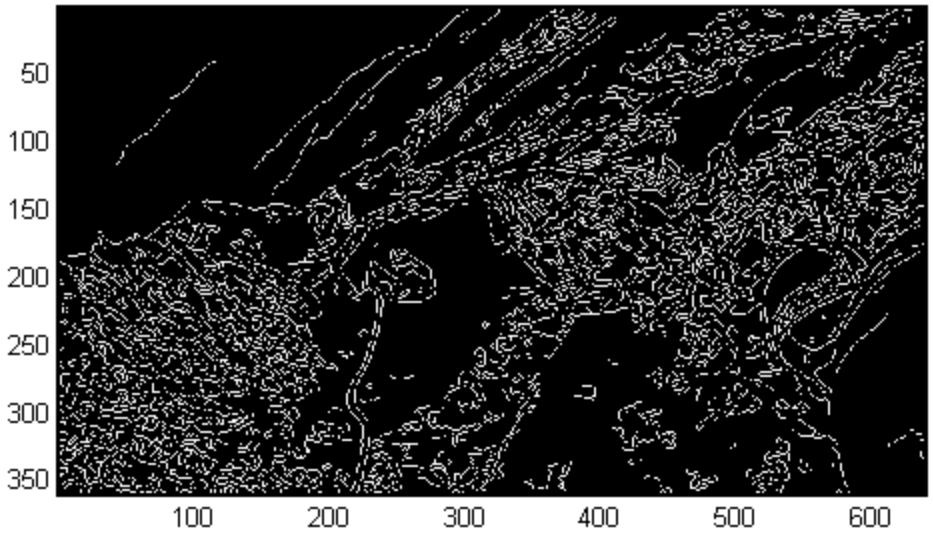
Code

```
Jb = rgb2gray(J);

imagesc(Jb);axis image; colormap(gray);

bw = edge(Jb,'canny');
```





Canny Edge Detection

$$B(i,j) = \begin{cases} 1 & \text{if } I(i,j) \text{ is edge} \\ 0 & \text{if } I(i,j) \text{ is not edge} \end{cases}$$

Objective: to localize edges given an image.

Original image, I

Binary image indicating edge pixels

Edge map image, B

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Canny Edge Detection

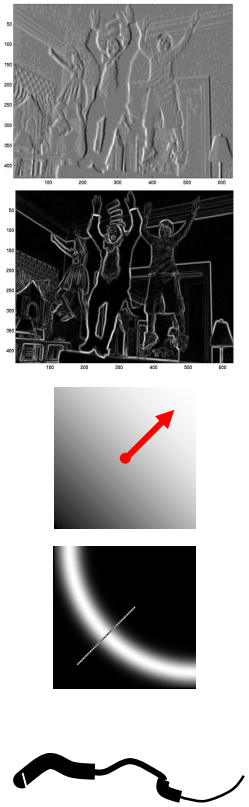
1. Filter image by derivatives of Gaussian

2. Compute magnitude of gradient

3. Compute edge orientation

4. Detect local maximum

5. Edge linking



Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

1) Compute Image Gradient

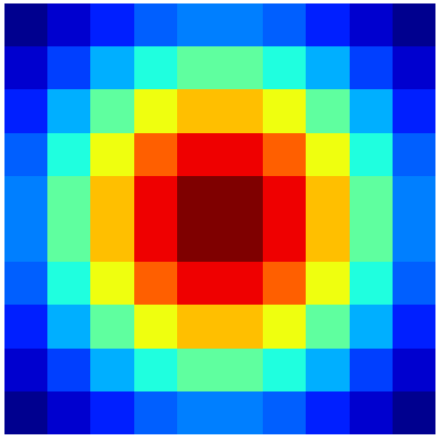
the first order derivative of Image I in x, and in y direction

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

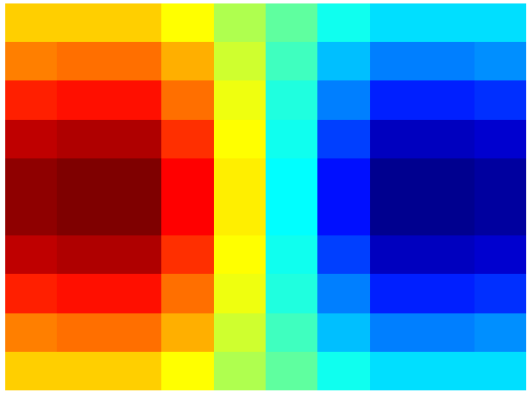
Edge Detection, Step 1, Filter out noise and compute derivative:

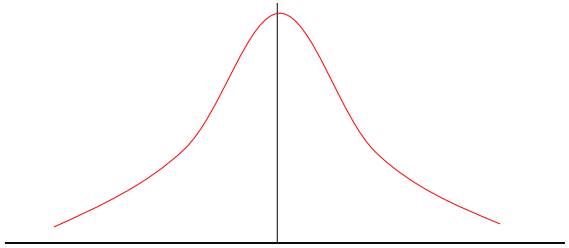
$$(\frac{\delta}{\delta x} \otimes G)$$

Gradient of Gaussian

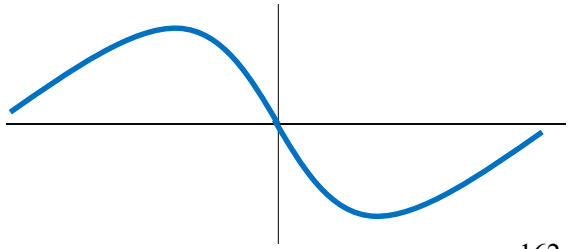


$$\frac{\delta}{\delta x}$$





$$\frac{\delta}{\delta x}$$



Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

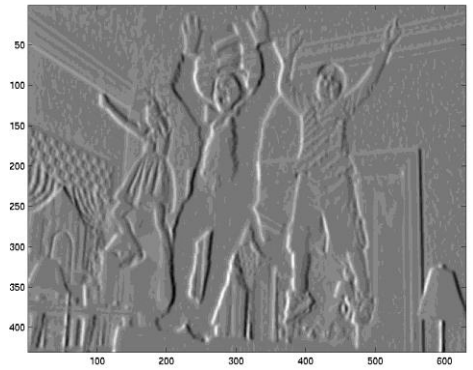
Edge Detection, Step 1, Filter out noise and compute derivative:

Image

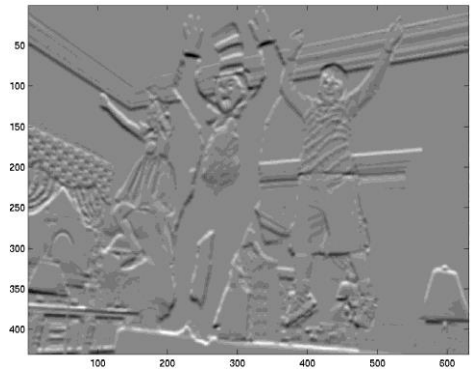
$$\otimes\left(\frac{\delta}{\delta x} \otimes G\right)$$

Smoothed Derivative

I_x



I_y



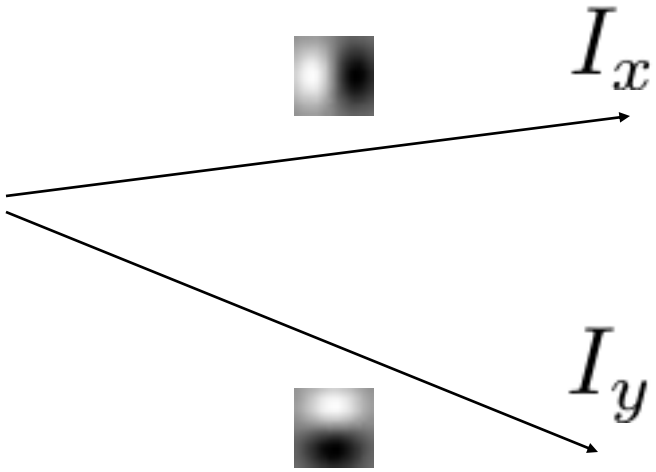
Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

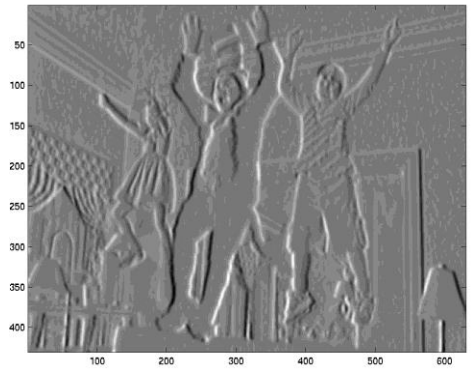
Edge Detection, Step 1, Filter out noise and compute derivative:

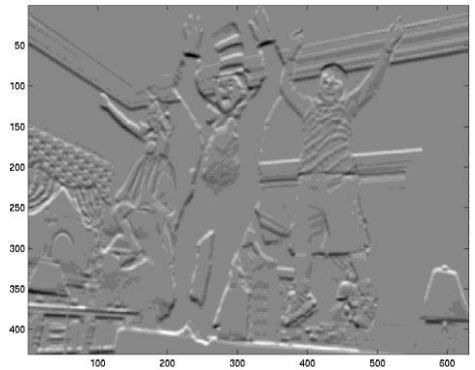
In matlab:

>> [dx,dy] = gradient(G); % G is a 2D gaussain

>> Ix = conv2(I,dx,'same'); Iy = conv2(I,dy,'same');



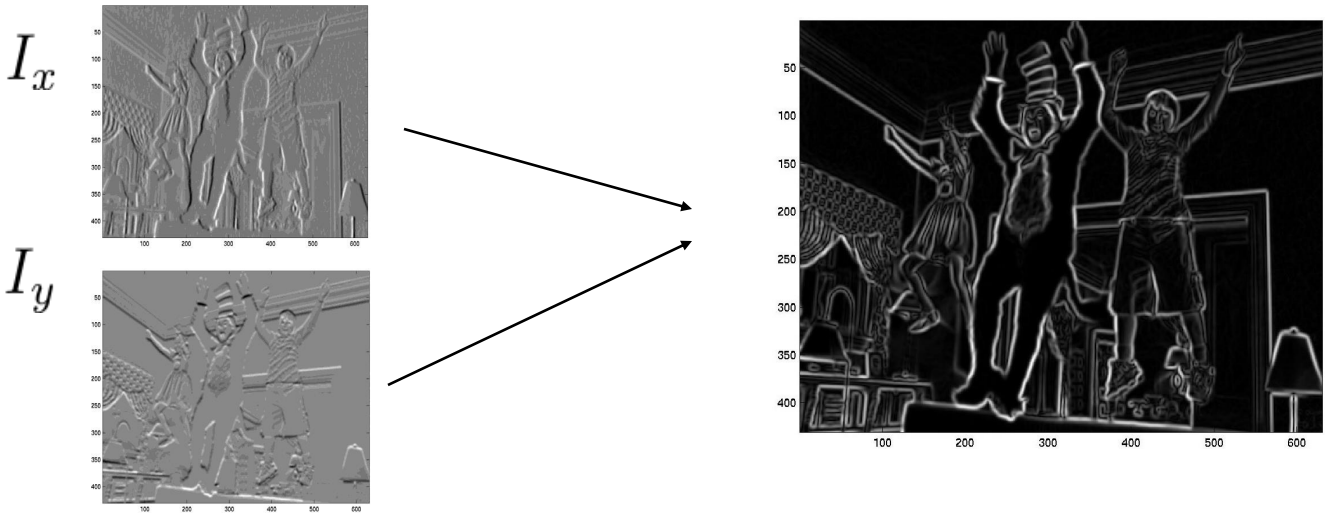




Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

Edge Detection: Step 2
Compute the magnitude of the gradient

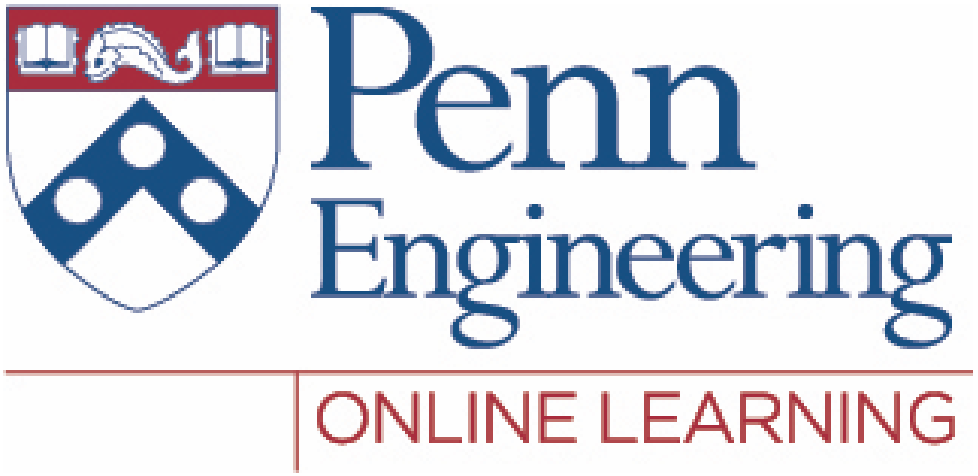
In Matlab:
>> Im = sqrt(Ix.*Ix + Iy.*Iy);



Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

We know roughly where are the edges, but we need their precise location.

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi



Video 2.15
Jianbo Shi

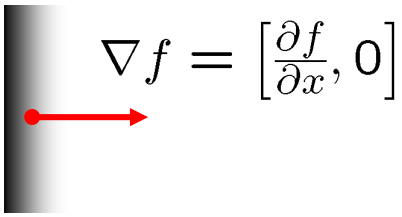
Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

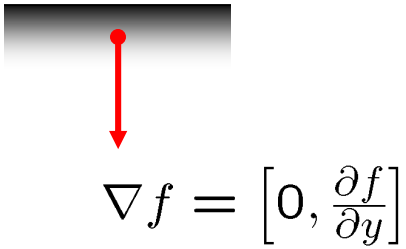
Finding the orientation of the edge

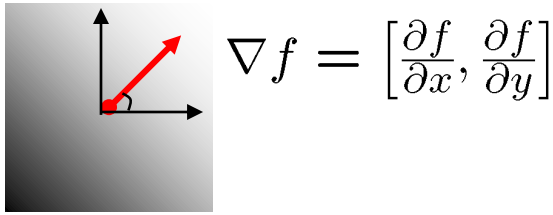
- The gradient of an image:

$$\nabla f = \left[\frac{\partial f}{\partial x}, \frac{\partial f}{\partial y}\right]$$

- The gradient points in the direction of most rapid change in intensity







- The image gradient direction is given by:

$$\theta = \tan^{-1}\left(\frac{\partial f}{\partial y} / \frac{\partial f}{\partial x}\right)$$

  - how does this relate to the direction of the edge?

$$\theta_{edge} = tan^{-1}(-\frac{\delta f}{\delta x} / \frac{\delta f}{\delta y})$$

Property of University of Pennsylvania, Kostas Daniilidis and Jianbo Shi

```
%% define image gradient operator
dy = [1;-1];
dx = [1,-1];

%% compute image gradient in x and y
AA_y = conv2(AA,dy,'same');
AA_x = conv2(AA,dx,'same');

Jy = AA_y(1:end-2,2:end-1);
Jy(1,:) = 0;

Jx = AA_x(2:end-1,1:end-2);
Jx(:,1) = 0;

%% display the image gradient flow
